LMC7660 Switched Capacitor Voltage Converter

Check for Samples: LMC7660

FEATURES

- **Operation Over Full Temperature and Voltage Range without an External Diode**
- **Low Supply Current, 200 µA Max**
- **Pin-for-pin Replacement for the 7660**
- **Wide Operating Range 1.5V to 10V**
- **97% Voltage Conversion Efficiency**
- **95% Power Conversion Efficiency**
- **Easy to Use, Only 2 External Components**
- **Extended Temperature Range**

DESCRIPTION

The LMC7660 is a CMOS voltage converter capable of converting a positive voltage in the range of +1.5V to +10V to the corresponding negative voltage of −1.5V to −10V. The LMC7660 is a pin-for-pin replacement for the industry-standard 7660. The converter features: operation over full temperature and voltage range without need for an external diode, low quiescent current, and high power efficiency.

The LMC7660 uses its built-in oscillator to switch 4 power MOS switches and charge two inexpensive electrolytic capacitors.

Block Diagram
Pin Configuration
These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS[(1)(2)]

Supply Voltage	10.5V
Input Voltage on Pin 6, 7[(3)]	−0.3V to $(V^+ + 0.3V)$
	for $V^+ < 5.5V$
	$(V^+ − 5.5V)$ to $(V^+ + 0.3V)$

θ_{JA}[(4)]	
PDIP Package	90°C/W
SOIC Package	160°C/W
Storage Temp. Range	−65°C ≤ T ≤ 150°C
Lead Temperature	
(Soldering, 5 sec.)	260°C
ESD Tolerance [(5)]	± 2000V

(1) Absolute Maximum ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions. See Note (1) under Electrical Characteristics for conditions.
(2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
(3) Connecting any input terminal to voltages greater than V^+ or less than ground may cause destructive latchup. It is recommended that no inputs from sources operating from external supplies be applied prior to "power-up" of the LMC7660.
(4) For operation at elevated temperature, these devices must be derated based on a thermal resistance of θ_{ja} and T_j max, $T_j = T_A + \theta_{ja} P_D$.
(5) The test circuit consists of the human body model of 100 pF in series with 1500Ω.

ELECTRICAL CHARACTERISTICS[(1)]

Symbol	Parameter	Conditions	Typ	LMC7660IN/ LMC7660IM Limit [(2)]	Units Limits
I_S	Supply Current	$R_L = \infty$	120	200	µA
				400	max
V^+H	Supply Voltage Range High [(3)]	$R_L = 10$ kΩ, Pin 6 Open	3 to 10	3 to 10	V
		Voltage Efficiency ≥ 90%		**3 to 10**	
V^+L	Supply Voltage Range Low	$R_L = 10$ kΩ, Pin 6 to Gnd.	1.5 to 3.5	1.5 to 3.5	V
		Voltage Efficiency ≥ 90%		**1.5 to 3.5**	

(1) Boldface numbers apply at temperature extremes. All other numbers apply at $T_A = 25°C$, $V^+ = 5V$, $C_{osc} = 0$, and apply for the LMC7660 unless otherwise specified. Test circuit is shown in Figure 1 .
(2) Limits at room temperature are specified and 100% production tested. Limits in **boldface** are specified over the operating temperature range (but not 100% tested), and are not used to calculate outgoing quality levels.
(3) The LMC7660 can operate without an external diode over the full temperature and voltage range. The LMC7660 can also be used with the external diode Dx, when replacing previous 7660 designs.

APPLICATION INFORMATION

CIRCUIT DESCRIPTION

The LMC7660 contains four large CMOS switches which are switched in a sequence to provide supply inversion $V_{out} = -V_{in}$. Energy transfer and storage are provided by two inexpensive electrolytic capacitors. Figure 11 shows how the LMC7660 can be used to generate $-V^+$ from V^+. When switches S1 and S3 are closed, C_p charges to the supply voltage V^+. During this time interval, switches S2 and S4 are open. After C_p charges to V^+, S1 and S3 are opened, S2 and S4 are then closed. By connecting S2 to ground, C_p develops a voltage $-V^+/2$ on C_r. After a number of cycles C_r will be pumped to exactly $-V^+$. This transfer will be exact assuming no load on C_r, and no loss in the switches.

In the circuit of Figure 11, S1 is a P-channel device and S2, S3, and S4 are N-channel devices. Because the output is biased below ground, it is important that the p⁻ wells of S3 and S4 never become forward biased with respect to either their sources or drains. A substrate logic circuit specifies that these p⁻ wells are always held at the proper voltage. Under all conditions S4 p⁻ well must be at the lowest potential in the circuit. To switch off S4, a level translator generates $V_{GS4} = 0V$, and this is accomplished by biasing the level translator from the S4 p⁻ well.

An internal RC oscillator and ÷ 2 circuit provide timing signals to the level translator. The built-in regulator biases the oscillator and divider to reduce power dissipation on high supply voltage. The regulator becomes active at about $V^+ = 6.5V$. Low voltage operation can be improved if the LV pin is shorted to ground for $V^+ \leq 3.5V$. For $V^+ \geq 3.5V$, the LV pin must be left open to prevent damage to the part.

POWER EFFICIENCY AND RIPPLE

It is theoretically possible to approach 100% efficiency if the following conditions are met:
1. The drive circuitry consumes little power.
2. The power switches are matched and have low R_{on}.
3. The impedance of the reservoir and pump capacitors are negligibly small at the pumping frequency.

The LMC7660 closely approaches 1 and 2 above. By using a large pump capacitor C_p, the charge removed while supplying the reservoir capacitor is small compared to C_p's total charge. Small removed charge means small changes in the pump capacitor voltage, and thus small energy loss and high efficiency. The energy loss by C_p is:

$$E = \tfrac{1}{2}C_p \left(V1^2 - V2^2 \right)$$

(1)

By using a large reservoir capacitor, the output ripple can be reduced to an acceptable level. For example, if the load current is 5 mA and the accepted ripple is 200 mV, then the reservoir capacitor can omit approximately be calculated from:

$$Is = C_r \frac{dv}{dt}$$

$$\sim C_r \times \frac{V_{ripple\ p\text{-}p}}{4/F_{osc}} \qquad C_r = \frac{0.5\ mA}{0.5V/ms} = 10\ \mu F$$

(2)

PRECAUTIONS

1. Do not exceed the maximum supply voltage or junction temperature.
2. Do not short pin 6 (LV terminal) to ground for supply voltages greater than 3.5V.
3. Do not short circuit the output to V^+.
4. External electrolytic capacitors C_r and C_p should have their polarities connected as shown in Figure 1.

REPLACING PREVIOUS 7660 DESIGNS

To prevent destructive latchup, previous 7660 designs require a diode in series with the output when operated at elevated temperature or supply voltage. Although this prevented the latchup problem of these designs, it lowered the available output voltage and increased the output series resistance.

The TI LMC7660 has been designed to solve the inherent latch problem. The LCM7660 can operate over the entire supply voltage and temperature range without the need for an output diode. When replacing existing designs, the LMC7660 can be operated with diode Dx.
Figure 11. Idealized Voltage Converter

TYPICAL APPLICATIONS

CHANGING OSCILLATOR FREQUENCY

It is possible to dramatically reduce the quiescent operating current of the LMC7660 by lowering the oscillator frequency. The oscillator frequency can be lowered from a nominal 10 kHz to several hundred hertz, by adding a slow-down capacitor C_{osc} (Figure 12). As shown in the Typical Performance Curves the supply current can be lowered to the 10 µA range. This low current drain can be extremely useful when used in µPower and battery back-up equipment. It must be understood that the lower operating frequency and supply current cause an increased impedance of C_r and C_p. The increased impedance, due to a lower switching rate, can be offset by raising C_r and C_p until ripple and load current requirements are met.

SYNCHRONIZING TO AN EXTERNAL CLOCK

Figure 13 shows an LMC7660 synchronized to an external clock. The CMOS gate overrides the internal oscillator when it is necessary to switch faster or reduce power supply interference. The external clock still passes through the ÷2 circuit in the 7660, so the pumping frequency will be ½ the external clock frequency.

Figure 12. Reduce Supply Current by Lowering Oscillator Frequency
Figure 13. Synchronizing to an External Clock

Product Folder Links: LMC7660

LOWERING OUTPUT IMPEDANCE

Paralleling two or more LMC7660's lowers output impedance. Each device must have it's own pumping capacitor C_p, but the reservoir capacitor C_r is shared as depicted in Figure 14. The composite output resistance is:

$$R_{out} = \frac{R_{out} \text{ of one LMC7660}}{\text{Number of devices}}$$

(3)

INCREASING OUTPUT VOLTAGE

Stacking the LMC7660s is an easy way to produce a greater negative voltage. It should be noted that the input current required for each stage is twice the load current on that stage as shown in Figure 15. The effective output resistance is approximately the sum of the individual R_{out} values, and so only a few levels of multiplication can be used.

It is possible to generate −15V from +5V by connecting the second 7660's pin 8 to +5V instead of ground as shown in Figure 16. Note that the second 7660 sees a full 20V and the input supply should not be increased beyond +5V.

Figure 14. Lowering Output Resistance by Paralleling Devices

Figure 15. Higher Voltage by Cascade

Figure 16. Getting −15V from +5V

Product Folder Links: *LMC7660*

SPLIT V⁺ IN HALF

Figure 17 is one of the more interesting applications for the LMC7660. The circuit can be used as a precision voltage divider (for very light loads), alternately it is used to generate a ½ supply point in battery applications. In the ½ cycle when S1 and S3 are closed, the supply voltage divides across the capacitors in a conventional way proportional to their value. In the ½ cycle when S2 and S4 are closed, the capacitors switch from a series connection to a parallel connection. This forces the capacitors to have the same voltage; the charge redistributes to maintain precisely $V^+/2$, across C_p and C_r. In this application all devices are only $V^+/2$, and the supply voltage can be raised to 20V giving exactly 10V at V_{out}.

GETTING UP … AND DOWN

The LMC7660 can also be used as a positive voltage multiplier. This application, shown in Figure 18, requires 2 additional diodes. During the first ½ cycle S2 charges C_p1 through D1; D2 is reverse biased. In the next ½ cycle S2 is open and S1 is closed. Since C_p1 is charged to $V^+ - V_{D1}$ and is referenced to V^+ through S1, the junction of D1 and D2 is at $V^+ + (V^+ - V_{D1})$. D1 is reverse biased in this interval. This application uses only two of the four switches in the 7660. The other two switches can be put to use in performing a negative conversion at the same time as shown in Figure 19. In the ½ cycle that D1 is charging C_p1, C_p2 is connected from ground to $-V_{out}$ via S2 and S4, and C_r2 is storing C_p2's charge. In the interval that S1 and S3 are closed, C_p1 pumps the junction of D1 and D2 above V^+, while C_p2 is refreshed from V^+.

Submit Documentation Feedback   9

THERMOMETER SPANS 180°C

Using the combined negative and positive multiplier of Figure 20 with an LM35 it is possible to make a μPower thermometer that spans a 180°C temperature range. The LM35 temperature sensor has an output sensitivity of 10 mV/°C, while drawing only 50 μA of quiescent current. In order for the LM35 to measure negative temperatures, a pull down to a negative voltage is required. Figure 20 shows a thermometer circuit for measuring temperatures from −55°C to +125°C and requiring only two 1.5V cells. End of battery life can be extended by replacing the up converter diodes with Schottky's.

REGULATING −V$_{OUT}$

It is possible to regulate the output of the LMC7660 and still maintain μPower performance. This is done by enclosing the LMC7660 in a loop with a LP2951. The circuit of Figure 21 will regulate V$_{out}$ to −5V for I$_L$ = 10 mA, and V$_{in}$ = 6V. For V$_{in}$ > 7V, the output stays in regulation up to I$_L$ = 25 mA. The error flag on pin 5 of the LP2951 sets low when the regulated output at pin 4 drops by about 5%. The LP2951 can be shutdown by taking pin 3 high; the LMC7660 can be shutdown by shorting pin 7 and pin 8.

The LP2951 can be reconfigured to an adjustable type regulator, which means the LMC7660 can give a regulated output from −2.0V to −10V dependent on the resistor ratios R1 and R2, as shown in Figure 22, V$_{ref}$ = 1.235V:

$$V_{out} = V_{ref}\left(1 + \frac{R1}{R2}\right)$$

(4)

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
