

Video Output

Description

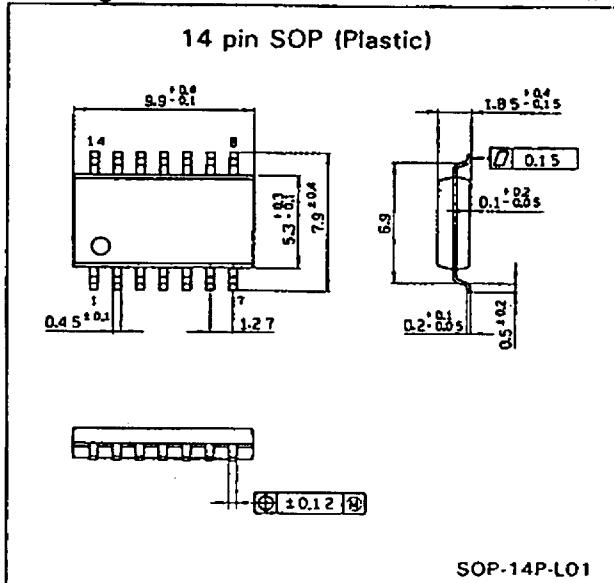

CX20095A is a bipolar IC designed as a driver of $75\ \Omega$ line (transmission and receiving line) used in the video signal system. It is comprised of a $75\ \Omega$ line drive, receiving amplifier and 6 dB amplifier for multi-purpose applications.

Features

- Low power supply voltage operation, $V_{cc} = 5V$ (Typ.)
- Transmission/Receiving amplifier has a built-in sync chip clamp.
- Bilateral communication configuration is possible with one line.
- Driver amplifier and 6dB amplifier are provided with power-saving function.
- Simple superimpose is possible with the trans amplifier.

Package Outline

Unit: mm

SOP-14P-L01

Structure

Bipolar silicon monolithic IC

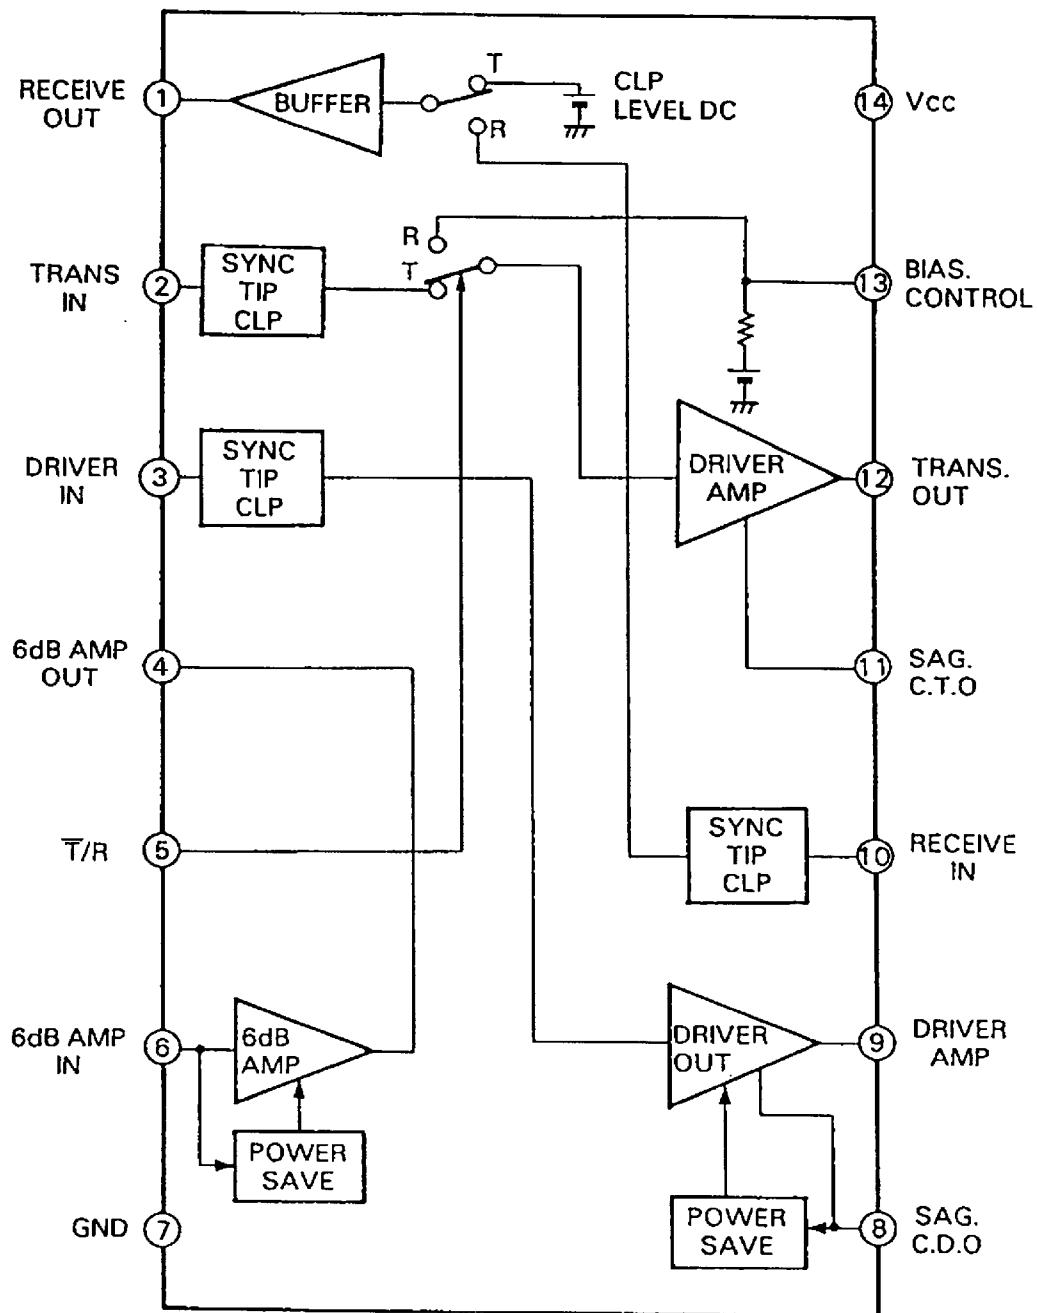

Absolute Maximum Ratings ($T_a = 25^\circ C$)

• Supply voltage	V_{cc}	17	V
• Operating temperature	T_{opr}	-10 to +65	$^\circ C$
• Storage temperature	T_{stg}	-55 to +150	$^\circ C$
• Allowable power dissipation	PD	500	mW

Recommended Operating Condition

• Supply voltage	V_{cc}	4.8 to 5.2	V
------------------	----------	------------	---

Block Diagram and Pin Configuration (Top view)

Pin Description

(See the Electrical Characteristics Test Circuit)
DC voltage when no signal is input, Ta = 25°C.

No.	Name	Voltage (V) standard value	Description
1	RECEIVE OUT	1.65	When pin 5 is at "H", the signal input from pin 10 is output with gain 0 dB. DC is output when pin 5 is at "L".
2	TRANS IN	1.28	Trans amplifier input: As sync chip clamp may result, a low impedance input is required.
3	DRIVER IN	1.28	Drive amplifier input: As sync chip clamp may result, a low impedance input is required.
4	6 dB AMP OUT	2.35	The signal input from pin 6 is output with gain 6 dB.
5	T/R	0	Mode switching pin Trans/Receive: Receive mode at "H" (over 4V) and Trans mode at "L" (less than 1V).
6	6 dB AMP IN	2.45	6 dB amplifier input: Input impedance more than approx. 10 kΩ, DC 2.4V
7	GND	0	
8	SAG.C.D.O.	1.29	The pin 9 sag is corrected by adding the sag component in the pin 9 output. Refer to Electrical Characteristics Test Circuit.
9	DRIVER OUT	1.08	Driver amplifier output: 75 Ω line drive is output. The signal input from pin 3 is output with gain 6 dB.
10	RECEIVE IN	1.74	Receiving amplifier input: As sync chip clamp may result, a low impedance input is required.
11	SAG.C.T.O.	1.30	The pin 12 sag is corrected by adding the sag component in the pin 12 output. Refer to Electrical Characteristics Test Circuit.
12	TRANS. OUT	1.10	Trans amplifier output: The signal input from pin 2 when pin 5 is at "L" is output to the 75 Ω line with a gain of 6 dB. A DC voltage determined at pin 13 is output when pin 5 is at "H".
13	BIAS. CONTROL	2.13	When pin 5 is at "H", its voltage is varied to vary the pin 12 output (DC) in turn. By linking with pin 5, simple superimpose can be possible in the pin 12 output. (In this case, the pin 1 output is affected.)
14	Vcc	5.0	+5.0V
