DESCRIPTION

The HY62V8100B is a high speed, low power and 1M bit CMOS SRAM organized as 131,072 words by 8bit. The HY62V8100B uses high performance CMOS process technology and designed for high speed low power circuit technology. It is particulary well suited for used in high density low power system application. This device has a data retention mode that guarantees data to remain valid at a minimum power supply voltage of 2.0V.

FEATURES

- Fully static operation and Tri-state output
- TTL compatible inputs and outputs
- Battery backup(LL-part)
  -. 2.0V(min) data retention
- Standard pin configuration
  -. 32 SOP - 525mil
  -. 32 TSOP-I - 8X20(Standard and Reversed)
  -. 32 sTSOP-I - 8X13.4
  (Standard and Reversed)

Note
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is stress rating only and the functional operation of the device under these or any other conditions above those indicated in the operation of this specification is not implied. Exposure to the absolute maximum rating conditions for extended period may affect reliability.

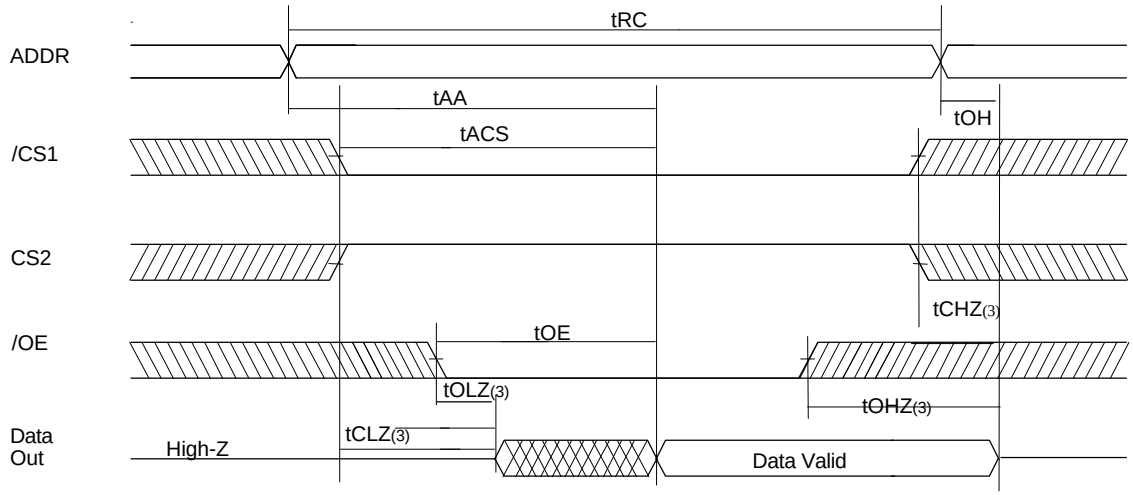
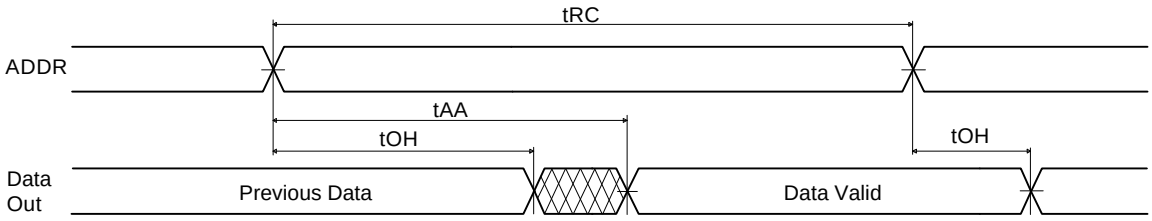
TIMING DIAGRAM

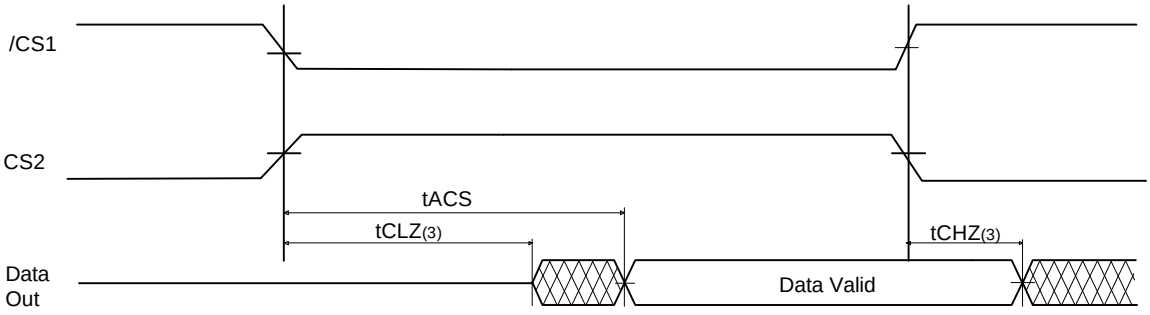
READ CYCLE 1(Note 1,4)



READ CYCLE 2(Note 1,2,4)

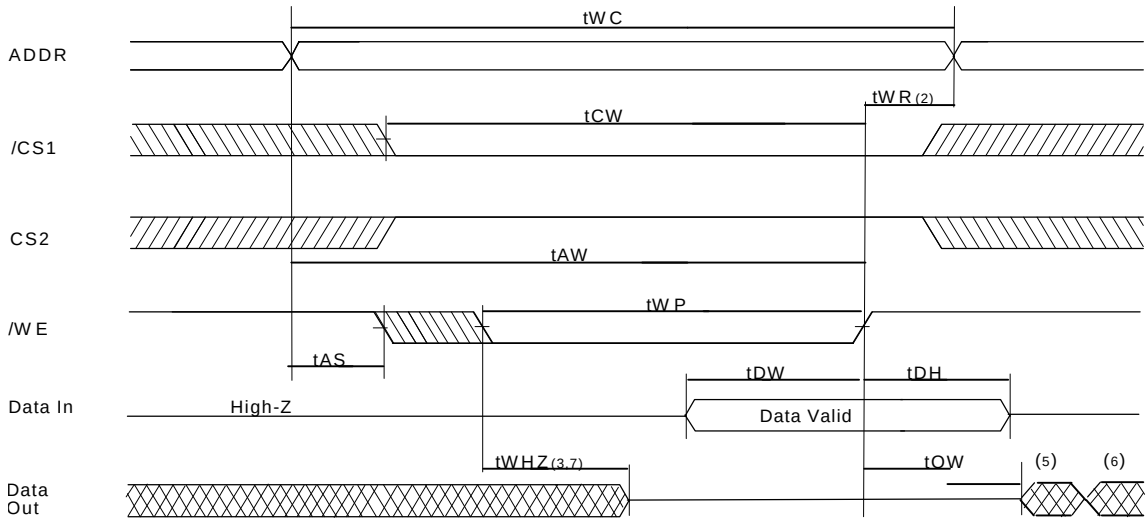


READ CYCLE 3(Note 1,2,4)

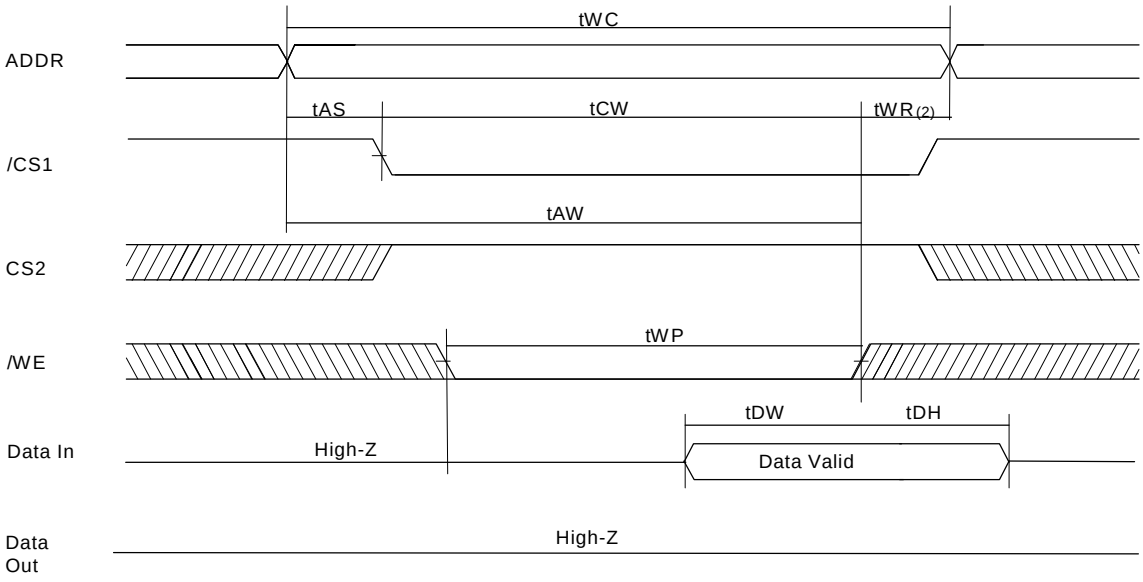


Notes:
1. A read occurs during the overlap of a low /OE, a high /WE, a low /CS1 and a high CS2.
2. /OE = V_{IL}
3. Transition is measured ± 200mV from steady state voltage.
   This parameter is sampled and not 100% tested.
4. /CS1 in high for the standby, low for active
   CS2 in low for the standby, high for active

WRITE CYCLE 1(1,4,5,8) (/WE Controlled)



WRITE CYCLE 2 (Note 1,4,5,8) (/CS1, CS2 Controlled)



Notes:
1. A write occurs during the overlap of a low /WE, a low /CS1 and a high CS2.
2. tWR is measured from the earlier of /CS1 or /WE going high or CS2 going low to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the output must not be applied.
4. If the the /CS1 low transition and CS2 high transition occur simultaneously with the /WE low transition or after the /WE transition, outputs remain in a high impedance state.
5. Q(data out) is the same phase with the write data of this write cycle.
6. Q(data out) is the read data of the next address.
7. Transition is measured ±200mV from steady state.
   This parameter is sampled and not 100% tested.
8. /CS1 in high for the standby, low for active
   CS2 in low for the standby, high for active
