3:0	0h RW	<b>reg_gp_sp_stream_stat_b_irq_enable:</b> This register enables the SP streaming stat b irq output for each of the 4 ports

### 15.8.15 reg\_gpd\_gp\_reg\_reg\_gp\_isp\_stream\_stat\_irq\_enable\_type (gpd\_gp\_reg\_reg\_gp\_isp\_stream\_stat\_irq\_enable)—Offset 38h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_isp\_stream\_stat\_irq\_enable:**  
[ISPMMADR] + 38h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_isp_stream_stat_irq_enable:</b> Unused
13:0	0h RW	<b>reg_gp_isp_stream_stat_irq_enable:</b> This register enables the ISP streaming stat irq output for each of the 14 ports

### 15.8.16 reg\_gpd\_gp\_reg\_reg\_gp\_mod\_stream\_stat\_irq\_enable\_type (gpd\_gp\_reg\_reg\_gp\_mod\_stream\_stat\_irq\_enable)—Offset 3Ch

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_mod\_stream\_stat\_irq\_enable:**  
[ISPMMADR] + 3Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_reg_gp_mod_stream_stat_irq_enable:</b> Unused
15:0	0h RW	<b>reg_gp_mod_stream_stat_irq_enable:</b> This register enables the MOD streaming stat irq output for each of the 16 ports

### 15.8.17 **reg\_gpd\_gp\_reg\_reg\_gp\_switch\_if\_type** (**gpd\_gp\_reg\_reg\_gp\_switch\_if**)—Offset 40h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_switch\_if:** [ISPMADR] + 40h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_switch_if:</b> Unused

Bit Range	Default & Access	Description
0	0h RW	<b>reg_gp_switch_if:</b> Selects the control stream switch for the primary input formatter and for primary input formatter b. The input formatters can be controlled by the scalar processor (value=1) or by the ISP (value=0)

### 15.8.18 **reg\_gpd\_gp\_reg\_reg\_gp\_switch\_gdc1\_type (gpd\_gp\_reg\_reg\_gp\_switch\_gdc1)–Offset 44h**

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_switch\_gdc1:** [ISPMADR] + 44h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_switch_gdc1:</b> Unused
0	0h RW	<b>reg_gp_switch_gdc1:</b> Selects the control stream switch for the GDC1. GDC1 can be controlled by the scalar processor (value=1) or the ISP (value=0)

### 15.8.19 **reg\_gpd\_gp\_reg\_reg\_gp\_switch\_gdc2\_type (gpd\_gp\_reg\_reg\_gp\_switch\_gdc2)–Offset 48h**

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_switch\_gdc2:** [ISPMADR] + 48h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
								reg_gp_switch_gdc2
								unused_reg_gp_switch_gdc2

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_switch_gdc2:</b> Unused
0	0h RW	<b>reg_gp_switch_gdc2:</b> Selects the control stream switch for the GDC2. GDC2 can be controlled by the scalar processor (value=1) or the ISP (value=0)

## 15.8.20 reg\_gpd\_gp\_reg\_reg\_gp\_srst\_type (gpd\_gp\_reg\_reg\_gp\_srst)—Offset 4Ch

Soft reset for several modules in the system. If '1' is written to a bit, the module(s) connected to that bit are held in reset until a '0' is written to that bit.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_srst:** [ISPMADDR] + 4Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																					
0	0	0	0	0	0	0	0	0

31:29	0h RW	<b>unused_reg_gp_srst:</b> Unused
28	0h RW	<b>SRST_WBUS:</b> soft reset bit for the wide bus

Bit Range	Default & Access	Description
27	0h RW	<b>SRST_HOST12BUS:</b> soft reset bit for the bus from host to fifo adapters
26	0h RW	<b>SRST_NBUS:</b> soft reset bit for the narrow bus
25	0h RW	<b>SRST_OCP2CIO:</b> soft reset bit for the OCP2CIO converter
24	0h RW	<b>SRST_SP:</b> soft reset bit for the SP
23	0h RW	<b>SRST_SF_GDC2_CELLS:</b> soft reset bit for the FIFOs between the GDC2 and the cells
22	0h RW	<b>SRST_SF_GDC1_CELLS:</b> soft reset bit for the FIFOs between the GDC1 and the cells
21	0h RW	<b>SRST_SF_DMA_CELLS:</b> soft reset bit for the FIFOs between the DMA and the cells
20	0h RW	<b>SRST_SF_ISYS_SP:</b> soft reset bit for the FIFOs between the input system and the SP
19	0h RW	<b>SRST_SF_MC_SP:</b> soft reset bit for the FIFOs between the stream2memory and the SP
18	0h RW	<b>SRST_SF_SIF_SP:</b> soft reset bit for the FIFOs between the secondary input formatter and the SP
17	0h RW	<b>SRST_SF_PIF_CELLS:</b> soft reset bit for the FIFOs between the primary input formatters and the cells
16	0h RW	<b>SRST_SF_ISP_SP:</b> soft reset bit for the FIFOs between SP and ISP
15	0h RW	<b>SRST_DMA:</b> soft reset bit for the DMA
14	0h RW	<b>SRST_SLV_GRP_BUS:</b> soft reset bit for the slave group bus
13	0h RW	<b>SRST_ISP:</b> soft reset bit for the isp (vector processor)
12	0h RW	<b>SRST_VEC_BUS:</b> soft reset bit for the vector bus
11	0h RW	<b>SRST_GDC2:</b> soft reset bit for the GDC2 block
10	0h RW	<b>SRST_GDC1:</b> soft reset bit for the GDC1 block
9	0h RW	<b>SRST_IFT_SEC_PIPE:</b> soft reset bit for the CIO pipeline after the secondary input formatter
8	0h RW	<b>SRST_OSYS:</b> soft reset bit for the blocks in the output system cluster
7	0h RW	<b>SRST_FACELLFIFOS:</b> soft reset bit for the fifo's connected to the fifo adapter between host and cells
6	0h RW	<b>SRST_GPTIMER:</b> soft reset bit for the GP timer block
5	0h RW	<b>SRST_TC:</b> soft reset bit for the timed controller block

Bit Range	Default & Access	Description
4	0h RW	<b>SRST_GPIO</b> : soft reset bit for the gpio block
3	0h RW	<b>SRST_GPDEV_CBUS</b> : soft reset bit for the gp devices cluster control bus
2	0h RW	<b>SRST_IFMT_CBUS</b> : soft reset bit for the input formatting cluster control bus
1	0h RW	<b>SRST_ISEL_CBUS</b> : soft reset bit for the input selector cluster control bus
0	0h RW	<b>SRST_ISYS_CBUS</b> : soft reset bit for the input system control bus

### 15.8.21 reg\_gpd\_gp\_reg\_reg\_gp\_slv\_reg\_srst\_type (gpd\_gp\_reg\_reg\_gp\_slv\_reg\_srst)—Offset 50h

Soft reset for the slave accessible registers in some blocks. If '1' is written to a bit, the attached registers get their default value. They can only be overwritten after writing a '0' to this bit

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_slv\_reg\_srst:** [ISPMADDR] + 50h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
								SLV_REG_SRST_GDC2	
								SLV_REG_SRST_GDC1	
								SLV_REG_SRST_DMA	

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_reg_gp_slv_reg_srst</b> : Unused
2	0h RW	<b>SLV_REG_SRST_GDC2</b> : soft reset bit for the slave registers in the GDC2
1	0h RW	<b>SLV_REG_SRST_GDC1</b> : soft reset bit for the slave registers in the GDC1
0	0h RW	<b>SLV_REG_SRST_DMA</b> : soft reset bit for the slave registers in the DMA

## 15.8.22 reg\_gpd\_tc\_FifoWriteCmd\_type (gpd\_tc\_FifoWriteCmd)—Offset 100h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_tc\_FifoWriteCmd:** [ISPMADR] + 100h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
FifoWriteCmd									

Bit Range	Default & Access	Description
31:0	0h WO	<b>FifoWriteCmd:</b> Timed controller Command input. A Timed Controller command consists of 5 32-bit tokens that need to be written sequentially to this register location

## 15.8.23 reg\_gpd\_c\_gpio\_reg\_gpio\_doe\_type (gpd\_c\_gpio\_reg\_gpio\_doe)—Offset 400h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_doe:** [ISPMADR] + 400h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
unused_reg_gpio_doe				reg_gpio_doe					

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_doe:</b> Unused
11:0	0h RW	<b>reg_gpio_doe:</b> indicates for each bit whether it is intended to be an input (value='0') or an output (value='1')

## 15.8.24 reg\_gpd\_c\_gpio\_reg\_gpio\_do\_select\_type (gpd\_c\_gpio\_reg\_gpio\_do\_select)—Offset 404h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_select:** [ISPMADR] + 404h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
unused_reg_gpio_do_select				reg_gpio_do_select				

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_do_select:</b> Unused
11:0	0h RW	<b>reg_gpio_do_select:</b> indicates for each bit of gpio_do whether it should have the value from source 0 (value='0') or source 1 (value='1').

## 15.8.25 reg\_gpd\_c\_gpio\_reg\_gpio\_do\_0\_type (gpd\_c\_gpio\_reg\_gpio\_do\_0)—Offset 408h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_0:** [ISPMADR] + 408h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
unused_reg_gpio_do_0				reg_gpio_do_0				

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_do_0:</b> Unused
11:0	0h RW	<b>reg_gpio_do_0:</b> provides the value for each of the output bits (source 0)

### 15.8.26 **reg\_gpd\_c\_gpio\_reg\_gpio\_do\_1\_type** (**gpd\_c\_gpio\_reg\_gpio\_do\_1**)—Offset 40Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_1:** [ISPMADR] + 40Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gpio_do_1				reg_gpio_do_1				

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_do_1:</b> Unused
11:0	0h RW	<b>reg_gpio_do_1:</b> provides the value for each of the output bits (source 1)

### 15.8.27 **reg\_gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_0\_type** (**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_0**)—Offset 410h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_0:** [ISPMADR] + 410h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_reg_gpio_do_pwm_cnt_0:</b> Unused
5:0	0h RW	<b>reg_gpio_do_pwm_cnt_0:</b> indicates duty cycle for PWM output 0. value d means duty cycle d/64

### 15.8.28 reg\_gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_1\_type (gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_1)—Offset 414h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_1:** [ISPMADR] + 414h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_reg_gpio_do_pwm_cnt_1:</b> Unused

Bit Range	Default & Access	Description
5:0	0h RW	<b>reg_gpio_do_pwm_cnt_1</b> : indicates duty cycle for PWM output 1. value d means duty cycle d/64

### 15.8.29 **reg\_gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_2\_type** (gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_2)—Offset 418h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_2:** [ISPMMADR] + 418h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_reg_gpio_do_pwm_cnt_2:</b> Unused
5:0	0h RW	<b>reg_gpio_do_pwm_cnt_2:</b> indicates duty cycle for PWM output 2. value d means duty cycle d/64

### 15.8.30 **reg\_gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_3\_type** (gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_3)—Offset 41Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_cnt\_3:** [ISPMMADR] + 41Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_reg_gpio_do_pwm_cnt_3:</b> Unused
5:0	0h RW	<b>reg_gpio_do_pwm_cnt_3:</b> indicates duty cycle for PWM output 3. value d means duty cycle d/64

### 15.8.31 reg\_gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_main\_cnt\_type (gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_main\_cnt)—Offset 420h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_main\_cnt:** [ISPMADR] + 420h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:20	0h RW	<b>unused_reg_gpio_do_pwm_main_cnt:</b> Unused

Bit Range	Default & Access	Description
19:0	0h RW	<b>reg_gpio_do_pwm_main_cnt:</b> indicates wrapping value for PWM main counter

### 15.8.32 **reg\_gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_enable\_type** (**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_enable**)—Offset 424h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_do\_pwm\_enable:** [ISPMMADR] + 424h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
unused_reg_gpio_do_pwm_enable				reg_gpio_do_pwm_enable					

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_do_pwm_enable:</b> Unused
11:0	0h RW	<b>reg_gpio_do_pwm_enable:</b> indicates per bit whether PWM is on (value='1') or output is fixed '0' (value='0')

### 15.8.33 **reg\_gpd\_c\_gpio\_reg\_gpio\_di\_debouncemethod\_type** (**gpd\_c\_gpio\_reg\_gpio\_di\_debouncemethod**)—Offset 428h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di\_debouncemethod:** [ISPMMADR] + 428h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_reg_gpio_di_debouncemethod:</b> Unused
23:0	0h RW	<b>reg_gpio_di_debouncemethod:</b> indicates for each input bit which debouncing counter value is chosen: '00': debounce_cnt0, '01': debounce_cnt1, '10': debounce_cnt2, '11': debounce_cnt3'

### 15.8.34 reg\_gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt0\_type (gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt0)—Offset 42Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt0:** [ISPMADR] + 42Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_gpio_di_debounce_cnt0:</b> Indicates the period an input has to be stable before passing its value to the output*

### 15.8.35 **reg\_gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt1\_type** (gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt1)—Offset 430h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt1:** [ISPMADR] + 430h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_gpio_di_debounce_cnt1:</b> Indicates the period an input has to be stable before passing its value to the output*

### 15.8.36 **reg\_gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt2\_type** (gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt2)—Offset 434h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt2:** [ISPMADR] + 434h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_gpio_di_debounce_cnt2</b> : Indicates the period an input has to be stable before passing its value to the output

### 15.8.37 **reg\_gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt3\_type (gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt3)—Offset 438h**

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di\_debounce\_cnt3:** [ISPMMADR] + 438h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

reg_gpio_di_debounce_cnt3								

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_gpio_di_debounce_cnt3</b> : Indicates the period an input has to be stable before passing its value to the output

### 15.8.38 **reg\_gpd\_c\_gpio\_reg\_gpio\_di\_activelevel\_type (gpd\_c\_gpio\_reg\_gpio\_di\_activelevel)—Offset 43Ch**

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di\_activelevel:** [ISPMMADR] + 43Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000FFFh

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_di_activelevel:</b> Unused
11:0	FFFh RW	<b>reg_gpio_di_activelevel:</b> indicates for each bit whether it is intended to be active low (value='0') or active high (value='1').

### 15.8.39 reg\_gpd\_c\_gpio\_reg\_gpio\_di\_type (gpd\_c\_gpio\_reg\_gpio\_di)—Offset 440h

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_c\_gpio\_reg\_gpio\_di:** [ISPMADR] + 440h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000FFFh

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gpio_di:</b> Unused
11:0	FFFh RO	<b>reg_gpio_di:</b> contains the values of all debounced, active level compensated inputs

### 15.8.40 **reg\_gpd\_irq\_ctrl\_reg\_irq\_edge\_type** (gpd\_irq\_ctrl\_reg\_irq\_edge)—Offset 500h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_edge:** [ISPMADDR] + 500h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_irq_edge:</b> indicates for each bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

### 15.8.41 **reg\_gpd\_irq\_ctrl\_reg\_irq\_mask\_type** (gpd\_irq\_ctrl\_reg\_irq\_mask)—Offset 504h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_mask:** [ISPMADDR] + 504h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_irq_mask:</b> indicates for each bit of irq_di whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

### 15.8.42 **reg\_gpd\_irq\_ctrl\_reg\_irq\_status\_type** (gpd\_irq\_ctrl\_reg\_irq\_status)—Offset 508h

Indicates for each bit whether a non-masked interrupt has been generated (value='1'). Can be cleared by writing a '1' into the the corresponding bit of the req\_irq\_clear register.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_status:** [ISPMADDR] + 508h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0												
0	0	0	0	0	0	0	0	0												
IRQ_STAT_SP_SMON_B	IRQ_STAT_DMA	IRQ_STAT_SW_1	IRQ_STAT_SW_0	IRQ_STAT_GPTIMER_1	IRQ_STAT_GPTIMER_0	IRQ_STAT_ISYS_2	IRQ_STAT_SP_DMEM_ERROR	IRQ_STAT_SP_IMEM_ERROR	IRQ_STAT_ISP_DMEM_ERROR	IRQ_STAT_ISP_BAMEM_ERROR	IRQ_STAT_ISP_PMEM_ERROR	IRQ_STAT_MOD_SMON	IRQ_STAT_ISP_SMON	IRQ_STAT_SP_SMON	IRQ_STAT_IFMT	IRQ_STAT_ISEL	IRQ_STAT_ISYS	IRQ_STAT_ISP	IRQ_STAT_SP	IRQ_STAT_GPIO_PINS

Bit Range	Default & Access	Description
31	0h RO	<b>IRQ_STAT_SP_SMON_B:</b> Represents the irq status of the irq_out from the SP streaming monitor b
30	0h RO	<b>IRQ_STAT_DMA:</b> Represents the irq status of the DMA
29	0h RO	<b>IRQ_STAT_SW_1:</b> Represents the irq status of the GP register IRQ SW 1
28	0h RO	<b>IRQ_STAT_SW_0:</b> Represents the irq status of the GP register IRQ SW 0
27	0h RO	<b>IRQ_STAT_GPTIMER_1:</b> Represents the irq status of the irq[1] out signal from the GP Timer block
26	0h RO	<b>IRQ_STAT_GPTIMER_0:</b> Represents the irq status of the irq[0] out signal from the GP Timer block
25	0h RO	<b>IRQ_STAT_ISYS_2:</b> Represents the irq status of the irq out signal from the input system
24	0h RO	<b>IRQ_STAT_SP_DMEM_ERROR:</b> Represents the irq status of the error signal from the SP data memory
23	0h RO	<b>IRQ_STAT_SP_IMEM_ERROR:</b> Represents the irq status of the error signal from the SP instruction cache memory
22	0h RO	<b>IRQ_STAT_ISP_DMEM_ERROR:</b> Represents the irq status of the error signal from the ISP data memory
21	0h RO	<b>IRQ_STAT_ISP_BAMEM_ERROR:</b> Represents the irq status of the error signal from the ISP vector memory
20	0h RO	<b>IRQ_STAT_ISP_PMEM_ERROR:</b> Represents the irq status of the error signal from the ISP program memory
19	0h RO	<b>IRQ_STAT_MOD_SMON:</b> Represents the irq status of the irq_out from the MOD streaming monitor

Bit Range	Default & Access	Description
18	0h RO	<b>IRQ_STAT_ISP_SMON:</b> Represents the irq status of the irq_out from the ISP streaming monitor
17	0h RO	<b>IRQ_STAT_SP_SMON:</b> Represents the irq status of the irq_out from the SP streaming monitor
16	0h RO	<b>IRQ_STAT_IFMT:</b> Represents the irq status of the irq_out from the input formatting subsystem
15	0h RO	<b>IRQ_STAT_ISEL:</b> Represents the irq status of the irq_out from the input selector
14	0h RO	<b>IRQ_STAT_ISYS:</b> Represents the irq status of the irq_out from the input system
13	0h RO	<b>IRQ_STAT_ISP:</b> Represents the irq status of the irq_out from isp2300
12	0h RO	<b>IRQ_STAT_SP:</b> Represents the irq status of the irq_out from scalar processor
11:0	0h RO	<b>IRQ_STAT_GPIO_PINS:</b> Represents the irq status of the - potentially debounced - GPIO input pins

### 15.8.43 **reg\_gpd\_irq\_ctrl\_reg\_irq\_clear\_type** (**gpd\_irq\_ctrl\_reg\_irq\_clear**)—Offset 50Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_clear:** [ISPMADDR] + 50Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
reg_irq_clear																															

Bit Range	Default & Access	Description
31:0	0h WO	<b>reg_irq_clear:</b> Clears (set to '0') bits in reg_irq_status. When writing a '1' into a bit of this register, the corresponding bit in the req_irq_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the req_irq_status is not affected.

### 15.8.44 **reg\_gpd\_irq\_ctrl\_reg\_irq\_enable\_type** (**gpd\_irq\_ctrl\_reg\_irq\_enable**)—Offset 510h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_enable:** [ISPMADDR] + 510h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_irq_enable:</b> Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also affects the IRQ pin (value='1') or not (value='0')

### 15.8.45 reg\_gpd\_irq\_ctrl\_reg\_irq\_level\_not\_pulse\_type (gpd\_irq\_ctrl\_reg\_irq\_level\_not\_pulse)—Offset 514h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_level\_not\_pulse:** [ISPMADR] + 514h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_irq_level_not_pulse:</b> Indicates for each bit whether an interrupt cause is translated into a pulse (value='0') or into a constant level '1' (value='1') on the IRQ pin

### 15.8.46 reg\_gpd\_irq\_ctrl\_reg\_irq\_str\_out\_enable\_type (gpd\_irq\_ctrl\_reg\_irq\_str\_out\_enable)—Offset 518h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_irq\_ctrl\_reg\_irq\_str\_out\_enable:** [ISPMADR] + 518h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>reg_irq_str_out_enable:</b> Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also results in a send token on the irq_str_out port (value='1') or not (value='0')

### 15.8.47 reg\_gpd\_gptimer\_reg\_reset\_type (gpd\_gptimer\_reg\_reset)—Offset 600h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_reg\_reset:** [ISPMADR] + 600h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_reg_reset:</b> Unused
7:0	0h WO	<b>reg_reset:</b> GP Timer reset. Write '1' to bit x to reset timer x. Write 0xFF to reset all timers.

### 15.8.48 reg\_gpd\_gptimer\_overall\_enable\_type (gpd\_gptimer\_overall\_enable)—Offset 604h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_overall\_enable:** [ISPMADR] + 604h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_overall_enable:</b> Unused
0	0h RW	<b>overall_enable:</b> GP Timer enable. Write '1' to enable all enabled timers, write '0' to disable all timers.

### 15.8.49 reg\_gpd\_gptimer\_enable\_timer\_0\_type (gpd\_gptimer\_enable\_timer\_0)—Offset 608h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_0:** [ISPMADDR] + 608h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_enable_timer_0:</b> Unused
0	0h RW	<b>enable_timer_0:</b> GP Timer enable. Write '1' to enable timer 0. Write '0' to disable timer 0

### 15.8.50 reg\_gpd\_gptimer\_enable\_timer\_1\_type (gpd\_gptimer\_enable\_timer\_1)—Offset 60Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_1:** [ISPMADR] + 60Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_enable_timer_1:</b> Unused
0	0h RW	<b>enable_timer_1:</b> GP Timer enable. Write '1' to enable timer 1. Write '0' to disable timer 1

### 15.8.51 reg\_gpd\_gptimer\_enable\_timer\_2\_type (gpd\_gptimer\_enable\_timer\_2)–Offset 610h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_2:** [ISPMADR] + 610h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_enable_timer_2:</b> Unused
0	0h RW	<b>enable_timer_2:</b> GP Timer enable. Write '1' to enable timer 2. Write '0' to disable timer 2

## 15.8.52 reg\_gpd\_gptimer\_enable\_timer\_3\_type (gpd\_gptimer\_enable\_timer\_3)—Offset 614h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_3:** [ISPMADDR] + 614h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_enable_timer_3								enable_timer_3

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_enable_timer_3:</b> Unused
0	0h RW	<b>enable_timer_3:</b> GP Timer enable. Write '1' to enable timer 3. Write '0' to disable timer 3

## 15.8.53 reg\_gpd\_gptimer\_enable\_timer\_4\_type (gpd\_gptimer\_enable\_timer\_4)—Offset 618h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_4:** [ISPMADDR] + 618h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_enable_timer_4								enable_timer_4

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_enable_timer_4:</b> Unused
0	0h RW	<b>enable_timer_4:</b> GP Timer enable. Write '1' to enable timer 4. Write '0' to disable timer 4

### 15.8.54 reg\_gpd\_gptimer\_enable\_timer\_5\_type (gpd\_gptimer\_enable\_timer\_5)—Offset 61Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_5:** [ISPMMADR] + 61Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_enable_timer_5								enable_timer_5

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_enable_timer_5:</b> Unused
0	0h RW	<b>enable_timer_5:</b> GP Timer enable. Write '1' to enable timer 5. Write '0' to disable timer 5

### 15.8.55 reg\_gpd\_gptimer\_enable\_timer\_6\_type (gpd\_gptimer\_enable\_timer\_6)—Offset 620h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_6:** [ISPMMADR] + 620h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_enable_timer_6: Unused
0	0h RW	enable_timer_6: GP Timer enable. Write '1' to enable timer 6. Write '0' to disable timer 6

### 15.8.56 reg\_gpd\_gptimer\_enable\_timer\_7\_type (gpd\_gptimer\_enable\_timer\_7)—Offset 624h

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_enable\_timer\_7:** [ISPMMADR] + 624h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_enable_timer_7: Unused
0	0h RW	enable_timer_7: GP Timer enable. Write '1' to enable timer 7. Write '0' to disable timer 7

### 15.8.57 reg\_gpd\_gptimer\_value\_timer\_0\_type (gpd\_gptimer\_value\_timer\_0)—Offset 628h

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_value\_timer\_0:** [ISPMMADR] + 628h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_0:</b> Returns the value of timer 0

### 15.8.58 reg\_gpd\_gptimer\_value\_timer\_1\_type (gpd\_gptimer\_value\_timer\_1)—Offset 62Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_value\_timer\_1:** [ISPMMADR] + 62Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_1:</b> Returns the value of timer 1

### 15.8.59 reg\_gpd\_gptimer\_value\_timer\_2\_type (gpd\_gptimer\_value\_timer\_2)—Offset 630h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_value\_timer\_2:** [ISPMMADR] + 630h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_2:</b> Returns the value of timer 2

### 15.8.60 reg\_gpd\_gptimer\_value\_timer\_3\_type (gpd\_gptimer\_value\_timer\_3)—Offset 634h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_value\_timer\_3:** [ISPMADDR] + 634h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_3:</b> Returns the value of timer 3

### 15.8.61 reg\_gpd\_gptimer\_value\_timer\_4\_type (gpd\_gptimer\_value\_timer\_4)—Offset 638h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_value\_timer\_4:** [ISPMADDR] + 638h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_4:</b> Returns the value of timer 4

### 15.8.62 reg\_gpd\_gptimer\_value\_timer\_5\_type (gpd\_gptimer\_value\_timer\_5)—Offset 63Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_value\_timer\_5:** [ISPMADDR] + 63Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_5:</b> Returns the value of timer 5

### 15.8.63 reg\_gpd\_gptimer\_value\_timer\_6\_type (gpd\_gptimer\_value\_timer\_6)—Offset 640h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_value\_timer\_6:** [ISPMADDR] + 640h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_6:</b> Returns the value of timer 6

### 15.8.64 reg\_gpd\_gptimer\_value\_timer\_7\_type (gpd\_gptimer\_value\_timer\_7)—Offset 644h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_value\_timer\_7:** [ISPMADR] + 644h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>value_timer_7:</b> Returns the value of timer 7

### 15.8.65 reg\_gpd\_gptimer\_count\_type\_timer\_0\_type (gpd\_gptimer\_count\_type\_timer\_0)—Offset 648h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_count\_type\_timer\_0:** [ISPMADR] + 648h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_count_type_timer_0:</b> Unused
1:0	0h RW	<b>count_type_timer_0:</b> Indicates what needs to be counted by timer 0, 00- # cycles the signal is high (1), 01- # cycles the signal is low (0), 10- # changes from low to high, 11- # changes from high to low

### 15.8.66 reg\_gpd\_gptimer\_count\_type\_timer\_1\_type (gpd\_gptimer\_count\_type\_timer\_1)—Offset 64Ch

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_count\_type\_timer\_1:** [ISPMMADR] + 64Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_count_type_timer_1:</b> Unused
1:0	0h RW	<b>count_type_timer_1:</b> Indicates what needs to be counted by timer 1, 00- # cycles the signal is high (1), 01- # cycles the signal is low (0), 10- # changes from low to high, 11- # changes from high to low

### 15.8.67 reg\_gpd\_gptimer\_count\_type\_timer\_2\_type (gpd\_gptimer\_count\_type\_timer\_2)—Offset 650h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_count\_type\_timer\_2:** [ISPMADR] + 650h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_count_type_timer_2:</b> Unused
1:0	0h RW	<b>count_type_timer_2:</b> Indicates what needs to be counted by timer 2, 00- # cycles the signal is high (1), 01- # cycles the signal is low (0), 10- # changes from low to high, 11- # changes from high to low

### 15.8.68 reg\_gpd\_gptimer\_count\_type\_timer\_3\_type (gpd\_gptimer\_count\_type\_timer\_3)—Offset 654h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_count\_type\_timer\_3:** [ISPMADR] + 654h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_count_type_timer_3:</b> Unused
1:0	0h RW	<b>count_type_timer_3:</b> Indicates what needs to be counted by timer 3, 00- # cycles the signal is high (1), 01- # cycles the signal is low (0), 10- # changes from low to high, 11- # changes from high to low

### 15.8.69 reg\_gpd\_gptimer\_count\_type\_timer\_4\_type (gpd\_gptimer\_count\_type\_timer\_4)—Offset 658h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_count\_type\_timer\_4:** [ISPMMADR] + 658h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

## 15.8.73 reg\_gpd\_gptimer\_signal\_select\_timer\_0\_type (gpd\_gptimer\_signal\_select\_timer\_0)—Offset 668h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_0:** [ISPMMADR] + 668h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_0:</b> Unused
5:0	0h RW	<b>signal_select_timer_0:</b> Selects which of the 55 input signals is counted by timer 0

### 15.8.74 reg\_gpd\_gptimer\_signal\_select\_timer\_1\_type (gpd\_gptimer\_signal\_select\_timer\_1)–Offset 66Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_1:** [ISPMADR] + 66Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_1:</b> Unused
5:0	0h RW	<b>signal_select_timer_1:</b> Selects which of the 55 input signals is counted by timer 1

### 15.8.75 reg\_gpd\_gptimer\_signal\_select\_timer\_2\_type (gpd\_gptimer\_signal\_select\_timer\_2)—Offset 670h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_2:** [ISPMADDR] + 670h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_2:</b> Unused
5:0	0h RW	<b>signal_select_timer_2:</b> Selects which of the 55 input signals is counted by timer 2

### 15.8.76 reg\_gpd\_gptimer\_signal\_select\_timer\_3\_type (gpd\_gptimer\_signal\_select\_timer\_3)—Offset 674h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_3:** [ISPMADDR] + 674h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_3:</b> Unused
5:0	0h RW	<b>signal_select_timer_3:</b> Selects which of the 55 input signals is counted by timer 3

### 15.8.77 reg\_gpd\_gptimer\_signal\_select\_timer\_4\_type (gpd\_gptimer\_signal\_select\_timer\_4)–Offset 678h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_4:** [ISPMADR] + 678h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_4:</b> Unused
5:0	0h RW	<b>signal_select_timer_4:</b> Selects which of the 55 input signals is counted by timer 4

### 15.8.78 reg\_gpd\_gptimer\_signal\_select\_timer\_5\_type (gpd\_gptimer\_signal\_select\_timer\_5)—Offset 67Ch

#### Access Method

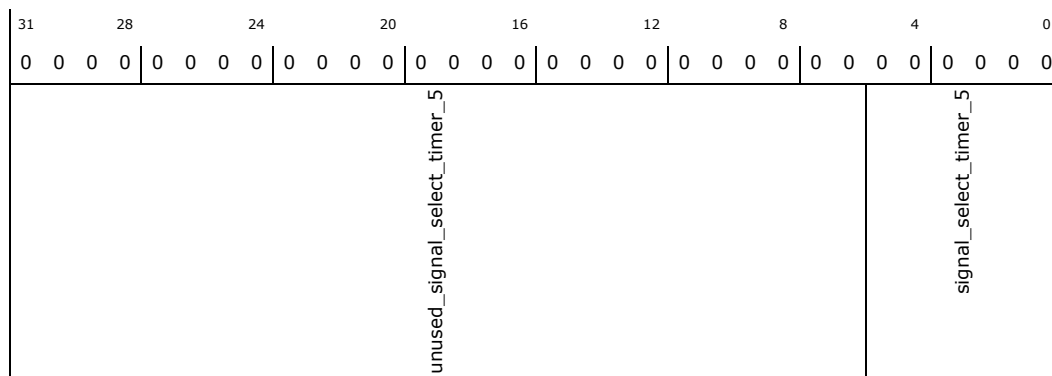

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_5:** [ISPMADDR] + 67Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_5:</b> Unused
5:0	0h RW	<b>signal_select_timer_5:</b> Selects which of the 55 input signals is counted by timer 5

### 15.8.79 reg\_gpd\_gptimer\_signal\_select\_timer\_6\_type (gpd\_gptimer\_signal\_select\_timer\_6)—Offset 680h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_6:** [ISPMADDR] + 680h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_6:</b> Unused
5:0	0h RW	<b>signal_select_timer_6:</b> Selects which of the 55 input signals is counted by timer 6

### 15.8.80 reg\_gpd\_gptimer\_signal\_select\_timer\_7\_type (gpd\_gptimer\_signal\_select\_timer\_7) – Offset 684h

#### Access Method

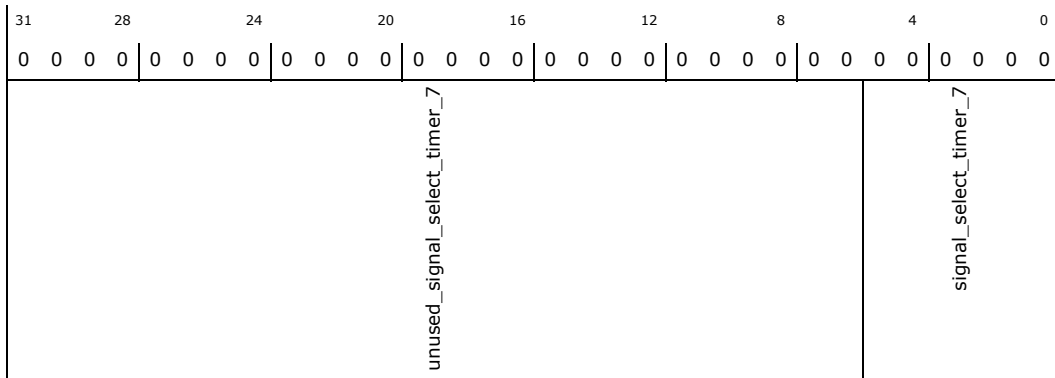

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_signal\_select\_timer\_7:** [ISPMMADR] + 684h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_signal_select_timer_7:</b> Unused
5:0	0h RW	<b>signal_select_timer_7:</b> Selects which of the 55 input signals is counted by timer 7

### 15.8.81 reg\_gpd\_gptimer\_irq\_trigger\_value\_0\_type (gpd\_gptimer\_irq\_trigger\_value\_0)—Offset 688h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_irq\_trigger\_value\_0:** [ISPMADDR] + 688h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>irq_trigger_value_0:</b> IRQ trigger value for interrupt 0. If the timer selected by irq_timer_select_0 reaches this value, irq_0 will be enabled

### 15.8.82 reg\_gpd\_gptimer\_irq\_trigger\_value\_1\_type (gpd\_gptimer\_irq\_trigger\_value\_1)—Offset 68Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_irq\_trigger\_value\_1:** [ISPMADDR] + 68Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>irq_trigger_value_1:</b> IRQ trigger value for interrupt 1. If the timer selected by irq_timer_select_1 reaches this value, irq_1 will be enabled

### 15.8.83 reg\_gpd\_gptimer\_irq\_timer\_select\_0\_type (gpd\_gptimer\_irq\_timer\_select\_0)—Offset 690h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_irq\_timer\_select\_0:** [ISPMADR] + 690h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	unused_irq_timer_select_0: Unused
2:0	0h RW	irq_timer_select_0: Indicates which of the 8 timers will be used for irq_0 generation

### 15.8.84 reg\_gpd\_gptimer\_irq\_timer\_select\_1\_type (gpd\_gptimer\_irq\_timer\_select\_1)—Offset 694h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**gpd\_gptimer\_irq\_timer\_select\_1:** [ISPMADR] + 694h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_irq_timer_select_1:</b> Unused
2:0	0h RW	<b>irq_timer_select_1:</b> Indicates which of the 8 timers will be used for irq_1 generation

### 15.8.85 **reg\_gpd\_gptimer\_irq\_enable\_0\_type (gpd\_gptimer\_irq\_enable\_0)–Offset 698h**

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_irq\_enable\_0:** [ISPMMADR] + 698h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
<b>unused_irq_enable_0</b>								<b>irq_enable_0</b>

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_irq_enable_0:</b> Unused
0	0h RW	<b>irq_enable_0:</b> Enable interrupt 0

### 15.8.86 **reg\_gpd\_gptimer\_irq\_enable\_1\_type (gpd\_gptimer\_irq\_enable\_1)–Offset 69Ch**

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gptimer\_irq\_enable\_1:** [ISPMMADR] + 69Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_irq_enable_1: Unused
0	0h RW	irq_enable_1: Enable interrupt 1

### 15.8.87 reg\_scp\_stat\_and\_ctrl\_type (scp\_stat\_and\_ctrl)–Offset 10000h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**scp\_stat\_and\_ctrl:** [ISPMADR] + 10000h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 000000A0h

Bit Range	Default & Access	Description
31:29	0h RW	unused_stat_and_ctrl: Unused
28:24	0h RW	arb_cont_dmem_Arb_mem_wp_source1: Arbiter contender group bandwidth for dmem_Arb_mem_wp_source1

Bit Range	Default & Access	Description
23:19	0h RW	<b>arb_cont_dmem_Arb_mem_wp_source0</b> : Arbiter contender group bandwidth for dmem_Arb_mem_wp_source0
18:14	0h RW	<b>arb_period_dmem_Arb_mem_wp</b> : Arbiter period for dmem_Arb_mem_wp
13	0h RW	<b>prefetch_enable_flag</b> : Prefetch enable flag for config_ilm_conf_ilm_icache
12	0h RW	<b>invalidate_cache_flag</b> : Invalidate cache flag for config_ilm_conf_ilm_icache
11	0h RW	<b>sleeping_irq_mask_flag</b> : Sleeping IRQ mask flag
10	0h RW	<b>ready_irq_mask_flag</b> : Ready IRQ mask flag
9	0h RW	<b>broken_irq_mask_flag</b> : Broken IRQ mask flag
8	0h RW	<b>irq_clear_flag</b> : IRQ clear flag
7	1h RO	<b>stalling_flag</b> : Stalling flag. Set to one when not executing an instruction.
6	0h RO	<b>sleeping_flag</b> : Sleeping flag
5	1h RO	<b>ready_flag</b> : Ready flag. Set to one when not executing a program.
4	0h RO	<b>broken_flag</b> : Broken flag
3	0h RW	<b>run_flag</b> : Run flag
2	0h RW	<b>break_flag</b> : Break flag
1	0h WO	<b>start_flag</b> : Start flag
0	0h WO	<b>reset_flag</b> : Reset flag

### 15.8.88 **reg\_scp\_base\_address\_type (scp\_base\_address)–Offset 10004h**

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**scp\_base\_address:** [ISPMMADR] + 10004h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>base_address:</b> Start address

### 15.8.89 reg\_scp\_unused\_2\_type (scp\_unused\_2)—Offset 10008h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**scp\_unused\_2:** [ISPMMADR] + 10008h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_EOF_Offset:</b> Unused
23:0	0h RW	<b>IF_EOF_Offset:</b> End of line offset in bytes: number of bytes to add at the address at the end of a line

### 15.8.117 reg\_ifmt\_ift\_prim\_IF\_Start\_addr\_type (ifmt\_ift\_prim\_IF\_Start\_addr)—Offset 30028h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_Start\_addr:** [ISPMADR] + 30028h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_Start_addr				IF_Start_addr				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_Start_addr:</b> Unused
23:0	0h RW	<b>IF_Start_addr:</b> Start address in bytes: memory buffer start address

### 15.8.118 reg\_ifmt\_ift\_prim\_IF\_End\_addr\_type (ifmt\_ift\_prim\_IF\_End\_addr)—Offset 3002Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_End\_addr:** [ISPMADR] + 3002Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_End_addr				IF_End_addr				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_End_addr:</b> Unused
23:0	0h RW	<b>IF_End_addr:</b> End address in bytes: memory buffer end address

### 15.8.119 reg\_ifmt\_ift\_prim\_IF\_incr\_type (ifmt\_ift\_prim\_IF\_incr)—Offset 30030h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_incr:** [ISPMADDR] + 30030h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_incr:</b> Unused
23:0	0h RW	<b>IF_incr:</b> Word increment in memory word: word increment value after writing each word

### 15.8.120 reg\_ifmt\_ift\_prim\_IF\_YUV\_420\_format\_type (ifmt\_ift\_prim\_IF\_YUV\_420\_format)—Offset 30034h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_YUV\_420\_format:** [ISPMADDR] + 30034h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_YUV_420_format:</b> Unused
0	0h RW	<b>IF_YUV_420_format:</b> YUV 420 format: set to work on legacy format YUV420

### 15.8.121 reg\_ifmt\_ift\_prim\_IF\_Vsynch\_active\_low\_type (ifmt\_ift\_prim\_IF\_Vsynch\_active\_low)—Offset 30038h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_Vsynch\_active\_low:** [ISPMMADR] + 30038h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

31:4	0h RW	<b>unused_IF_FSM_Sync_status:</b> Unused
3	0h RO	<b>FSM_Sync_error:</b> Error flag: when set in combination with: Idle state an unknown command has been received; Req. Lines state an unexpected vsynch or eof has been received; Req. Vectors state an unexpected vsynch or eof has been received; another state an illegal state transition has occurred.
2:0	0h RO	<b>FSM_Sync_State:</b> FSM State: State: 0)Idle -- 1)Req Frame -- 2)Req. Lines -- 3)Req. Vectors -- 4)Send Acknowledge

### 15.8.127 reg\_ifmt\_ift\_prim\_FSM\_Sync\_counter\_type (ifmt\_ift\_prim\_FSM\_Sync\_counter)—Offset 30104h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_FSM\_Sync\_counter:** [ISPMMAADR] + 30104h

**ISPMMAADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMAADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_FSM_Sync_counter:</b> Unused
15:0	0h RO	<b>FSM_Sync_counter:</b> FSM Sync counter: counts the pixel components of the request being served (starting from value 1)

**15.8.128 reg\_ifmt\_ift\_prim\_FSM\_Crop\_status\_type (ifmt\_ift\_prim\_FSM\_Crop\_status)—Offset 30108h**

FSM Crop status

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_prim\_FSM\_Crop\_status:** [ISPMMADR] + 30108h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_FSM_Crop_status:</b> Unused
3	0h RO	<b>FSM_Crop_error:</b> Error flag: when set in combination with: Crop Line state unexpected vsynch or eof has been received; Req. Lines state unexpected vsynch or eof has been received; Req. Vectors state unexpected vsynch or eof has been received; another state an illegal state transition has occurred.

Bit Range	Default & Access	Description
2:0	0h RO	<b>FSM_Crop_State:</b> FSM State: State: 0)Idle -- 1)Wait Line -- 2)Crop Line -- 3)Crop Pixel -- 4)Pass pixel -- 5) Pass Line

### 15.8.129 reg\_ifmt\_ift\_prim\_FSM\_Crop\_line\_counter\_type (ifmt\_ift\_prim\_FSM\_Crop\_line\_counter)—Offset 3010Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_FSM\_Crop\_line\_counter:** [ISPMADR] + 3010Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

0	0	0	0	0	0	0	0	0	
								FSM_Padding_error	FSM_Padding_State
unused_IF_FSM_Padding_status									

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_IF_FSM_Padding_status:</b> Unused
3	0h RO	<b>FSM_Padding_error:</b> Error flag; when set in combination with: Left Padding state an unexpected vsynch or hsync has been received; Write state an unexpected vsynch or hsync has been received; Right padding state unexpected vsynch has been received; Send EOL state an unexpected vsynch has been received; another state an illegal state transition has occurred.
2:0	0h RO	<b>FSM_Padding_State:</b> FSM State: State: 0)Idle -- 1)Left Padding -- 2)Write -- 3)Right padding -- 4)Sending EOL

### 15.8.136 **reg\_ifmt\_ift\_prim\_IF\_FSM\_Padding\_elem\_idx\_type (ifmt\_ift\_prim\_IF\_FSM\_Padding\_elem\_idx)—Offset 30128h**

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_FSM\_Padding\_elem\_idx:** [ISPMADR] + 30128h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_IF_FSM_Padding_elem_idx:</b> Unused
5:0	0h RO	<b>IF_FSM_Padding_elem_idx:</b> FSM Padding element index counter

### 15.8.137 reg\_ifmt\_ift\_prim\_IF\_FSM\_Vec\_Sup\_type (ifmt\_ift\_prim\_IF\_FSM\_Vec\_Sup)—Offset 3012Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_FSM\_Vec\_Sup:** [ISPMADDR] + 3012Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_FSM_Vec_Sup:</b> Unused
0	0h RO	<b>IF_FSM_Vec_Sup:</b> FSM Vector support error state: if set the FSM Vector support is in error state

### 15.8.138 reg\_ifmt\_ift\_prim\_IF\_FSM\_Vec\_Sup\_Buf\_full\_type (ifmt\_ift\_prim\_IF\_FSM\_Vec\_Sup\_Buf\_full)—Offset 30130h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_IF\_FSM\_Vec\_Sup\_Buf\_full:** [ISPMMADR] + 30130h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

11:0	0h RW	<b>IF_Horiz_Decim:</b> Horizontal decimation factor

### 15.8.148 reg\_ifmt\_ift\_prim\_b\_IF\_Horiz\_Deinter\_type (ifmt\_ift\_prim\_b\_IF\_Horiz\_Deinter)—Offset 3021Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Horiz\_Deinter:** [ISPMMADR] + 3021Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_IF_Horiz_Deinter:</b> Unused
2:0	0h RW	<b>IF_Horiz_Deinter:</b> Horizontal deinterleaving factor

### 15.8.149 reg\_ifmt\_ift\_prim\_b\_IF\_Left\_Pad\_type (ifmt\_ift\_prim\_b\_IF\_Left\_Pad)—Offset 30220h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Left\_Pad:** [ISPMADR] + 30220h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_IF_Left_Pad:</b> Unused
5:0	0h RW	<b>IF_Left_Pad:</b> Left padding: pizel component to be padded at the begginig of each line

### 15.8.150 reg\_ifmt\_ift\_prim\_b\_IF\_EOF\_Offset\_type (ifmt\_ift\_prim\_b\_IF\_EOF\_Offset)—Offset 30224h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_EOF\_Offset:** [ISPMADR] + 30224h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_EOF_Offset:</b> Unused
23:0	0h RW	<b>IF_EOF_Offset:</b> End of line offset in bytes: number of bytes to add at the address at the end of a line

### 15.8.151 **reg\_ifmt\_ift\_prim\_b\_IF\_Start\_addr\_type** (ifmt\_ift\_prim\_b\_IF\_Start\_addr)—Offset 30228h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Start\_addr:** [ISPMMADR] + 30228h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_Start_addr:</b> Unused
23:0	0h RW	<b>IF_Start_addr:</b> Start address in bytes: memory buffer start address

### 15.8.152 **reg\_ifmt\_ift\_prim\_b\_IF\_End\_addr\_type** (ifmt\_ift\_prim\_b\_IF\_End\_addr)—Offset 3022Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_End\_addr:** [ISPMMADR] + 3022Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_End_addr:</b> Unused
23:0	0h RW	<b>IF_End_addr:</b> End address in bytes: memory buffer end address

### 15.8.153 reg\_ifmt\_ift\_prim\_b\_IF\_incr\_type (ifmt\_ift\_prim\_b\_IF\_incr)—Offset 30230h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_incr:** [ISPMADDR] + 30230h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_incr				IF_incr				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_incr:</b> Unused
23:0	0h RW	<b>IF_incr:</b> Word increment in memory word: word increment value after writing each word

### 15.8.154 reg\_ifmt\_ift\_prim\_b\_IF\_YUV\_420\_format\_type (ifmt\_ift\_prim\_b\_IF\_YUV\_420\_format)—Offset 30234h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_YUV\_420\_format:** [ISPMADDR] + 30234h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_YUV_420_format:</b> Unused
0	0h RW	<b>IF_YUV_420_format:</b> YUV 420 format: set to work on legacy format YUV420

### 15.8.155 reg\_ifmt\_ift\_prim\_b\_IF\_Vsynch\_active\_low\_type (ifmt\_ift\_prim\_b\_IF\_Vsynch\_active\_low)—Offset 30238h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Vsynch\_active\_low:** [ISPMADDR] + 30238h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_Vsynch_active_low:</b> Unused
0	0h RW	<b>IF_Vsynch_active_low:</b> Vertical synch active low: set to 1 if Vsynch and EndOfFrame are active low

### 15.8.156 reg\_ifmt\_ift\_prim\_b\_IF\_Hsynch\_active\_low\_type (ifmt\_ift\_prim\_b\_IF\_Hsynch\_active\_low)—Offset 3023Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Hsynch\_active\_low:** [ISPMMADR] + 3023Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_Hsynch_active_low								IF_Hsynch_active_low

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_Hsynch_active_low:</b> Unused
0	0h RW	<b>IF_Hsynch_active_low:</b> Horizontal synch active low: set to 1 if Hsynch and EndOfLine are active low

### 15.8.157 reg\_ifmt\_ift\_prim\_b\_IF\_ReEnable\_type (ifmt\_ift\_prim\_b\_IF\_ReEnable)—Offset 30240h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_ReEnable:** [ISPMMADR] + 30240h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_ReEnable								IF_ReEnable

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_ReEnable:</b> Unused
0	0h RW	<b>IF_ReEnable:</b> Re-enable status update: set to 1 to re-enable status update after an error situation

### 15.8.158 reg\_ifmt\_ift\_prim\_b\_IF\_block\_input\_type (ifmt\_ift\_prim\_b\_IF\_block\_input)—Offset 30244h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_block\_input:** [ISPMMADR] + 30244h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_block_input								IF_block_input

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_block_input:</b> Unused
0	0h RW	<b>IF_block_input:</b> Block input when no req: set to 1 to block data streaming input when no request is received

### 15.8.159 reg\_ifmt\_ift\_prim\_b\_IF\_Vert\_Deinter\_type (ifmt\_ift\_prim\_b\_IF\_Vert\_Deinter)—Offset 30248h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Vert\_Deinter:** [ISPMMADR] + 30248h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_IF_Vert_Deinter:</b> Unused
2:0	0h RW	<b>IF_Vert_Deinter:</b> Vertical deinterleaving factor

### 15.8.160 reg\_ifmt\_ift\_prim\_b\_IF\_FSM\_Sync\_status\_type (ifmt\_ift\_prim\_b\_IF\_FSM\_Sync\_status)—Offset 30300h

FSM Sync status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_FSM\_Sync\_status:** [ISPMMADR] + 30300h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_IF_FSM_Sync_status:</b> Unused
3	0h RO	<b>FSM_Sync_error:</b> Error flag: when set in combination with: Idle state an unknown command has been received; Req. Lines state an unexpected vsynch or eof has been received; Req. Vectors state an unexpected vsynch or eof has been received; another state an illegal state transition has occurred.

Bit Range	Default & Access	Description
2:0	0h RO	<b>FSM_Sync_State:</b> FSM State: State: 0)Idle -- 1)Req Frame -- 2)Req. Lines -- 3)Req. Vectors -- 4)Send Acknowledge

### 15.8.161 reg\_ifmt\_ift\_prim\_b\_FSM\_Sync\_counter\_type (ifmt\_ift\_prim\_b\_FSM\_Sync\_counter)—Offset 30304h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_FSM\_Sync\_counter:** [ISPMMADR] + 30304h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_FSM_Sync_counter				FSM_Sync_counter				

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_FSM_Sync_counter:</b> Unused
15:0	0h RO	<b>FSM_Sync_counter:</b> FSM Sync counter: counts the pixel components of the request being served (starting from value 1)

### 15.8.162 reg\_ifmt\_ift\_prim\_b\_FSM\_Crop\_status\_type (ifmt\_ift\_prim\_b\_FSM\_Crop\_status)—Offset 30308h

FSM Crop status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_FSM\_Crop\_status:** [ISPMMADR] + 30308h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0

unused_FSM_Horiz_Decim_cnt						FSM_Horiz_Decim_cnt		

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_FSM_Horiz_Decim_cnt:</b> Unused
11:0	0h RO	<b>FSM_Horiz_Decim_cnt:</b> FSM Horizontal Decimation counter

### 15.8.167 reg\_ifmt\_ift\_prim\_b\_FSM\_Vertic\_Decim\_cnt\_type (ifmt\_ift\_prim\_b\_FSM\_Vertic\_Decim\_cnt)—Offset 3031Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_FSM\_Vertic\_Decim\_cnt:** [ISPMMADR] + 3031Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_FSM_Vertic_Decim_cnt:</b> Unused
11:0	0h RO	<b>FSM_Vertic_Decim_cnt:</b> FSM Vertical decimation counter

### 15.8.168 reg\_ifmt\_ift\_prim\_b\_FSM\_Vertic\_Block\_Decim\_cnt\_type (ifmt\_ift\_prim\_b\_FSM\_Vertic\_Block\_Decim\_cnt)—Offset 30320h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_FSM\_Vertic\_Block\_Decim\_cnt:** [ISPMMADR] + 30320h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_FSM_Vertic_Block_Decim_cnt:</b> Unused
1:0	0h RO	<b>FSM_Vertic_Block_Decim_cnt:</b> FSM Vertical block decimation counter

### 15.8.169 reg\_ifmt\_ifmt\_prim\_b\_IF\_FSM\_Padding\_status\_type (ifmt\_ifmt\_prim\_b\_IF\_FSM\_Padding\_status)—Offset 30324h

FSM Padding status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ifmt\_prim\_b\_IF\_FSM\_Padding\_status:** [ISPMADR] + 30324h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_IF_FSM_Padding_status:</b> Unused
3	0h RO	<b>FSM_Padding_error:</b> Error flag; when set in combination with: Left Padding state an unexpected vsynch or hsync has been received; Write state an unexpected vsynch or hsync has been received; Right padding state unexpected vsynch has been received; Send EOL state an unexpected vsynch has been received; another state an illegal state transition has occurred.
2:0	0h RO	<b>FSM_Padding_State:</b> FSM State: State: 0)Idle -- 1)Left Padding -- 2)Write -- 3)Right padding -- 4)Sending EOL

### 15.8.170 **reg\_ifmt\_ift\_prim\_b\_IF\_FSM\_Padding\_elem\_idx\_type** (ifmt\_ift\_prim\_b\_IF\_FSM\_Padding\_elem\_idx)—Offset 30328h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_FSM\_Padding\_elem\_idx:** [ISPMADDR] + 30328h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_IF_FSM_Padding_elem_idx:</b> Unused
5:0	0h RO	<b>IF_FSM_Padding_elem_idx:</b> FSM Padding element index counter

### 15.8.171 **reg\_ifmt\_ift\_prim\_b\_IF\_FSM\_Vec\_Sup\_type** (ifmt\_ift\_prim\_b\_IF\_FSM\_Vec\_Sup)—Offset 3032Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_FSM\_Vec\_Sup:** [ISPMADDR] + 3032Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_FSM_Vec_Sup:</b> Unused
0	0h RO	<b>IF_FSM_Vec_Sup:</b> FSM Vector support error state: if set the FSM Vector support is in error state

### 15.8.172 **reg\_ifmt\_ifmt\_prim\_b\_IF\_FSM\_Vec\_Sup\_Buf\_full\_type** (ifmt\_ifmt\_prim\_b\_IF\_FSM\_Vec\_Sup\_Buf\_full)—Offset 30330h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ifmt\_prim\_b\_IF\_FSM\_Vec\_Sup\_Buf\_full:** [ISPMADR] + 30330h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_IF_FSM_Vec_Sup_Buf_full:</b> Unused
2:0	0h RO	<b>IF_FSM_Vec_Sup_Buf_full:</b> FSM Vector support buf full: one-hot encoding flag signaling that the correspondent buffer is full

### 15.8.173 reg\_ifmt\_ift\_prim\_b\_IF\_FSM\_Vec\_Sup\_rd\_accept\_type (ifmt\_ift\_prim\_b\_IF\_FSM\_Vec\_Sup\_rd\_accept)—Offset 30334h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_FSM\_Vec\_Sup\_rd\_accept:** [ISPMMAADR] + 30334h

**ISPMMAADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMAADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000001h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_FSM_Vec_Sup_rd_accept:</b> Unused
0	1h RO	<b>IF_FSM_Vec_Sup_rd_accept:</b> FSM Vector Support fifo rd accept flag

### 15.8.174 reg\_ifmt\_ift\_prim\_b\_IF\_Pixel\_Fifo\_status\_type (ifmt\_ift\_prim\_b\_IF\_Pixel\_Fifo\_status)—Offset 30338h

Pixel Fifo status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_prim\_b\_IF\_Pixel\_Fifo\_status:** [ISPMMAADR] + 30338h

**ISPMMAADR Type:** PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Description
0	0h RW	<b>IF_sw_rst:</b> Software Reset

### 15.8.176 reg\_ifmt\_ift\_sec\_IF\_start\_line\_type (ifmt\_ift\_sec\_IF\_start\_line)—Offset 30404h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_start\_line:** [ISPMMADR] + 30404h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_start_line				IF_start_line				

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_IF_start_line:</b> Unused
15:0	0h RW	<b>IF_start_line:</b> Start line: number of line to skip before passing the 1st line

### 15.8.177 reg\_ifmt\_ift\_sec\_IF\_start\_column\_type (ifmt\_ift\_sec\_IF\_start\_column)—Offset 30408h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_start\_column:** [ISPMMADR] + 30408h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_IF_start_column:</b> Unused
15:0	0h RW	<b>IF_start_column:</b> Start column: number pixel component to skip before passing the 1st of a line

### 15.8.178 reg\_ifmt\_ift\_sec\_IF\_Cropped\_height\_type (ifmt\_ift\_sec\_IF\_Cropped\_height)—Offset 3040Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Cropped\_height:** [ISPMMADR] + 3040Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_IF_Cropped_height:</b> Unused
15:0	0h RW	<b>IF_Cropped_height:</b> Cropped height: number of lines of the cropped image

### 15.8.179 reg\_ifmt\_ift\_sec\_IF\_Cropped\_width\_type (ifmt\_ift\_sec\_IF\_Cropped\_width)—Offset 30410h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Cropped\_width:** [ISPMADDR] + 30410h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_IF_Cropped_width:</b> Unused
15:0	0h RW	<b>IF_Cropped_width:</b> Cropped width: number of pixel component of the cropped image

### 15.8.180 reg\_ifmt\_ift\_sec\_IF\_Vert\_Decim\_type (ifmt\_ift\_sec\_IF\_Vert\_Decim)—Offset 30414h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Vert\_Decim:** [ISPMADDR] + 30414h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_IF_Vert_Decim:</b> Unused
11:0	0h RW	<b>IF_Vert_Decim:</b> Vertical decimation factor

### 15.8.181 reg\_ifmt\_ift\_sec\_IF\_Horiz\_Decim\_type (ifmt\_ift\_sec\_IF\_Horiz\_Decim)—Offset 30418h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Horiz\_Decim:** [ISPMADR] + 30418h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_Horiz_Decim				IF_Horiz_Decim				

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_IF_Horiz_Decim:</b> Unused
11:0	0h RW	<b>IF_Horiz_Decim:</b> Horizontal decimation factor

### 15.8.182 reg\_ifmt\_ift\_sec\_IF\_Horiz\_Deinter\_type (ifmt\_ift\_sec\_IF\_Horiz\_Deinter)—Offset 3041Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Horiz\_Deinter:** [ISPMADR] + 3041Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_IF_Horiz_Deinter:</b> Unused
2:0	0h RW	<b>IF_Horiz_Deinter:</b> Horizontal deinterleaving factor

### 15.8.183 reg\_ifmt\_ift\_sec\_IF\_Left\_Pad\_type (ifmt\_ift\_sec\_IF\_Left\_Pad)—Offset 30420h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Left\_Pad:** [ISPMADR] + 30420h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_IF_Left_Pad:</b> Unused
5:0	0h RW	<b>IF_Left_Pad:</b> Left padding: pizel component to be padded at the beggining of each line

### 15.8.184 reg\_ifmt\_ift\_sec\_IF\_EOF\_Offset\_type (ifmt\_ift\_sec\_IF\_EOF\_Offset)—Offset 30424h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_EOF\_Offset:** [ISPMADDR] + 30424h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_EOF_Offset				IF_EOF_Offset				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_EOF_Offset:</b> Unused
23:0	0h RW	<b>IF_EOF_Offset:</b> End of line offset in bytes: number of bytes to add at the address at the end of a line

### 15.8.185 reg\_ifmt\_ift\_sec\_IF\_Start\_addr\_type (ifmt\_ift\_sec\_IF\_Start\_addr)—Offset 30428h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Start\_addr:** [ISPMADDR] + 30428h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_Start_addr				IF_Start_addr				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_Start_addr:</b> Unused
23:0	0h RW	<b>IF_Start_addr:</b> Start address in bytes: memory buffer start address

### 15.8.186 reg\_ifmt\_ift\_sec\_IF\_End\_addr\_type (ifmt\_ift\_sec\_IF\_End\_addr)—Offset 3042Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_End\_addr:** [ISPMADR] + 3042Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_End_addr				IF_End_addr				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_End_addr:</b> Unused
23:0	0h RW	<b>IF_End_addr:</b> End address in bytes: memory buffer end address

### 15.8.187 reg\_ifmt\_ift\_sec\_IF\_incr\_type (ifmt\_ift\_sec\_IF\_incr)—Offset 30430h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_incr:** [ISPMADR] + 30430h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_incr				IF_incr				

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_IF_incr:</b> Unused

Bit Range	Default & Access	Description
23:0	0h RW	<b>IF_incr:</b> Word increment in memory word: word increment value after writing each word

### 15.8.188 reg\_ifmt\_ift\_sec\_IF\_YUV\_420\_format\_type (ifmt\_ift\_sec\_IF\_YUV\_420\_format)—Offset 30434h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_sec\_IF\_YUV\_420\_format:** [ISPMADR] + 30434h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_YUV_420_format								IF_YUV_420_format

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_YUV_420_format:</b> Unused
0	0h RW	<b>IF_YUV_420_format:</b> YUV 420 format: set to work on legacy format YUV420

### 15.8.189 reg\_ifmt\_ift\_sec\_IF\_Vsynch\_active\_low\_type (ifmt\_ift\_sec\_IF\_Vsynch\_active\_low)—Offset 30438h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Vsynch\_active\_low:** [ISPMADR] + 30438h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_Vsynch_active_low</b> : Unused
0	0h RW	<b>IF_Vsynch_active_low</b> : Vertical synch active low: set to 1 if Vsynch and EndOfFrame are active low

### 15.8.190 reg\_ifmt\_ift\_sec\_IF\_Hsynch\_active\_low\_type (ifmt\_ift\_sec\_IF\_Hsynch\_active\_low)–Offset 3043Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Hsynch\_active\_low:** [ISPMADR] + 3043Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_Hsynch_active_low</b> : Unused
0	0h RW	<b>IF_Hsynch_active_low</b> : Horizontal synch active low: set to 1 if Hsynch and EndOfLine are active low

### 15.8.191 reg\_ifmt\_ift\_sec\_IF\_ReEnable\_type (ifmt\_ift\_sec\_IF\_ReEnable)—Offset 30440h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_ReEnable:** [ISPMADR] + 30440h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_ReEnable								IF_ReEnable

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_ReEnable:</b> Unused
0	0h RW	<b>IF_ReEnable:</b> Re-enable status update: set to 1 to re-enable status update after an error situation

### 15.8.192 reg\_ifmt\_ift\_sec\_IF\_block\_input\_type (ifmt\_ift\_sec\_IF\_block\_input)—Offset 30444h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_block\_input:** [ISPMADR] + 30444h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_block_input								IF_block_input

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_block_input:</b> Unused
0	0h RW	<b>IF_block_input:</b> Block input when no req; set to 1 to block data streaming input when no request is received

### 15.8.193 reg\_ifmt\_ift\_sec\_IF\_Vert\_Deinter\_type (ifmt\_ift\_sec\_IF\_Vert\_Deinter)—Offset 30448h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Vert\_Deinter:** [ISPMMADR] + 30448h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_Vert_Deinter								IF_Vert_Deinter

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_IF_Vert_Deinter:</b> Unused
2:0	0h RW	<b>IF_Vert_Deinter:</b> Vertical deinterleaving factor

### 15.8.194 reg\_ifmt\_ift\_sec\_IF\_FSM\_Sync\_status\_type (ifmt\_ift\_sec\_IF\_FSM\_Sync\_status)—Offset 30500h

FSM Sync status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_FSM\_Sync\_status:** [ISPMMADR] + 30500h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_IF_FSM_Sync_status:</b> Unused
3	0h RO	<b>FSM_Sync_error:</b> Error flag: when set in combination with: Idle state an unknown command has been received; Req. Lines state an unexpected vsynch or eof has been received; Req. Vectors state an unexpected vsynch or eof has been received; another state an illegal state transition has occurred.
2:0	0h RO	<b>FSM_Sync_State:</b> FSM State: State: 0)Idle -- 1)Req Frame -- 2)Req. Lines -- 3)Req. Vectors -- 4)Send Acknowledge

### 15.8.195 reg\_ifmt\_ift\_sec\_FSM\_Sync\_counter\_type (ifmt\_ift\_sec\_FSM\_Sync\_counter)—Offset 30504h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_FSM\_Sync\_counter:** [ISPMADDR] + 30504h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_FSM_Sync_counter:</b> Unused

Bit Range	Default & Access	Description
31:15	0h RW	<b>unused_FSM_Crop_line_counter:</b> Unused
14:0	0h RO	<b>FSM_Crop_line_counter:</b> FSM Crop line counter

### 15.8.198 reg\_ifmt\_ift\_sec\_FSM\_Crop\_pixel\_counter\_type (ifmt\_ift\_sec\_FSM\_Crop\_pixel\_counter)—Offset 30510h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_ift\_sec\_FSM\_Crop\_pixel\_counter:** [ISPMADR] + 30510h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_FSM_Crop_pixel_counter:</b> Unused
15:0	0h RO	<b>FSM_Crop_pixel_counter:</b> FSM Crop pixel component counter

### 15.8.199 reg\_ifmt\_ift\_sec\_FSM\_Deinterl\_idx\_buffer\_type (ifmt\_ift\_sec\_FSM\_Deinterl\_idx\_buffer)—Offset 30514h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_FSM\_Deinterl\_idx\_buffer:** [ISPMADDR] + 30514h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_FSM_Deinterl_idx_buffer:</b> Unused
1:0	0h RO	<b>FSM_Deinterl_idx_buffer:</b> FSM Deinterleaving idx buffer

### 15.8.200 reg\_ifmt\_ift\_sec\_FSM\_Horiz\_Decim\_cnt\_type (ifmt\_ift\_sec\_FSM\_Horiz\_Decim\_cnt)—Offset 30518h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_FSM\_Horiz\_Decim\_cnt:** [ISPMADDR] + 30518h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

### 15.8.202 reg\_ifmt\_ift\_sec\_FSM\_Vertic\_Block\_Decim\_cnt\_type (ifmt\_ift\_sec\_FSM\_Vertic\_Block\_Decim\_cnt)—Offset 30520h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_FSM\_Vertic\_Block\_Decim\_cnt:** [ISPMADR] + 30520h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_FSM_Vertic_Block_Decim_cnt:</b> Unused
1:0	0h RO	<b>FSM_Vertic_Block_Decim_cnt:</b> FSM Vertical block decimation counter

### 15.8.203 reg\_ifmt\_ift\_sec\_IF\_FSM\_Padding\_status\_type (ifmt\_ift\_sec\_IF\_FSM\_Padding\_status)—Offset 30524h

FSM Padding status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_FSM\_Padding\_status:** [ISPMADR] + 30524h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_IF_FSM_Padding_elem_idx:</b> Unused
5:0	0h RO	<b>IF_FSM_Padding_elem_idx:</b> FSM Padding element index counter

### 15.8.205 reg\_ifmt\_ift\_sec\_IF\_FSM\_Vec\_Sup\_type (ifmt\_ift\_sec\_IF\_FSM\_Vec\_Sup)—Offset 3052Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_FSM\_Vec\_Sup:** [ISPMMADR] + 3052Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IF_FSM_Vec_Sup								IF_FSM_Vec_Sup

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_IF_FSM_Vec_Sup:</b> Unused
0	0h RO	<b>IF_FSM_Vec_Sup:</b> FSM Vector support error state: if set the FSM Vector support is in error state

### 15.8.206 reg\_ifmt\_ift\_sec\_IF\_FSM\_Vec\_Sup\_Buf\_full\_type (ifmt\_ift\_sec\_IF\_FSM\_Vec\_Sup\_Buf\_full)—Offset 30530h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_FSM\_Vec\_Sup\_Buf\_full:** [ISPMMADR] + 30530h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
0	1h RO	<b>IF_FSM_Vec_Sup_rd_accept:</b> FSM Vector Support fifo rd accept flag

### 15.8.208 reg\_ifmt\_ift\_sec\_IF\_Pixel\_Fifo\_status\_type (ifmt\_ift\_sec\_IF\_Pixel\_Fifo\_status)—Offset 30538h

Pixel Fifo status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_ift\_sec\_IF\_Pixel\_Fifo\_status:** [ISPMADDR] + 30538h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
								Pixel_Fifo_rd_valid
								Pixel_Fifo_rd_accept
								Pixel_Fifo_wr_valid
								Pixel_Fifo_wr_accept
								unused_IF_Pixel_Fifo_status

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_IF_Pixel_Fifo_status:</b> Unused
3	0h RO	<b>Pixel_Fifo_rd_valid:</b> Fifo has an element to be read
2	0h RO	<b>Pixel_Fifo_rd_accept:</b> IF accepts Pixel(s)
1	0h RO	<b>Pixel_Fifo_wr_valid:</b> There is an element to write into the Fifo
0	1h RO	<b>Pixel_Fifo_wr_accept:</b> Fifo is not full(1), Fifo is Full(0)

### 15.8.209 reg\_ifmt\_mem\_cpy\_MemCopy\_sw\_rst\_type (ifmt\_mem\_cpy\_MemCopy\_sw\_rst)—Offset 30600h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_sw\_rst:** [ISPMADDR] + 30600h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_sw_rst:</b> Unused
0	0h RW	<b>MemCopy_sw_rst:</b> Software Reset

### 15.8.210 reg\_ifmt\_mem\_cpy\_MemCopy\_in\_endian\_type (ifmt\_mem\_cpy\_MemCopy\_in\_endian)—Offset 30604h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_in\_endian:** [ISPMMADR] + 30604h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_in_endian:</b> Unused
0	0h RW	<b>MemCopy_in_endian:</b> Input endianness : set to 1 if input is big endian

### 15.8.211 reg\_ifmt\_mem\_cpy\_MemCopy\_out\_endian\_type (ifmt\_mem\_cpy\_MemCopy\_out\_endian)—Offset 30608h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_out\_endian:** [ISPMADR] + 30608h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_out_endian:</b> Unused
0	0h RW	<b>MemCopy_out_endian:</b> Output endianness : set to 1 to deliver output input in big endian

### 15.8.212 reg\_ifmt\_mem\_cpy\_MemCopy\_bit\_swap\_type (ifmt\_mem\_cpy\_MemCopy\_bit\_swap)—Offset 3060Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_bit\_swap:** [ISPMADR] + 3060Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_bit_swap:</b> Unused
0	0h RW	<b>MemCopy_bit_swap:</b> Bit swapping : set to 1 to swap the bit of the incoming byte

### 15.8.213 reg\_ifmt\_mem\_cpy\_MemCopy\_block\_synch\_type (ifmt\_mem\_cpy\_MemCopy\_block\_synch)—Offset 30610h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_block\_synch:** [ISPMADR] + 30610h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_block_synch:</b> Unused
0	0h RW	<b>MemCopy_block_synch:</b> Block synchronization pulse active low: set to 1 if start of block and end of block are active low

### 15.8.214 reg\_ifmt\_mem\_cpy\_MemCopy\_packet\_synch\_type (ifmt\_mem\_cpy\_MemCopy\_packet\_synch)—Offset 30614h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_packet\_synch:** [ISPMADR] + 30614h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_packet_synch:</b> Unused
0	0h RW	<b>MemCopy_packet_synch:</b> Packet synchronization pulse active low: set to 1 if start of packet and end of packet are active low

### 15.8.215 reg\_ifmt\_mem\_cpy\_MemCopy\_rd\_post\_wr\_sync\_type (ifmt\_mem\_cpy\_MemCopy\_rd\_post\_wr\_sync)—Offset 30618h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_rd\_post\_wr\_sync:** [ISPMADR] + 30618h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_rd_post_wr_sync:</b> Unused
0	0h RW	<b>MemCopy_rd_post_wr_sync:</b> Enable read post write synchronization: set to 1 to enable read post write check before sending acknowledge

### 15.8.216 reg\_ifmt\_mem\_cpy\_MemCopy\_dual\_input\_type (ifmt\_mem\_cpy\_MemCopy\_dual\_input)—Offset 3061Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_dual\_input:** [ISPMMADR] + 3061Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_dual_input:</b> Unused

Bit Range	Default & Access	Description
0	0h RW	<b>MemCopy_dual_input:</b> Enable dual byte inputs: set to 1 to enable dual byte input

### 15.8.217 reg\_ifmt\_mem\_cpy\_MemCopy\_ReEnable\_type (ifmt\_mem\_cpy\_MemCopy\_ReEnable)—Offset 30620h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_ReEnable:** [ISPMMADR] + 30620h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_ReEnable:</b> Unused
0	0h RW	<b>MemCopy_ReEnable:</b> Re-enable status update: set to 1 to re-enable status update after an error situation

### 15.8.218 reg\_ifmt\_mem\_cpy\_MemCopy\_token\_data\_type (ifmt\_mem\_cpy\_MemCopy\_token\_data)—Offset 30700h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_token\_data:** [ISPMMADR] + 30700h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>MemCopy_token_data:</b> Token data on command port

### 15.8.219 reg\_ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_status\_type (ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_status)—Offset 30704h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_status:** [ISPMADDR] + 30704h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_MemCopy_FSM_Sync_status:</b> Unused
2:0	0h RO	<b>MemCopy_FSM_Sync_status:</b> FSM Synchronization Status: 0)Idle -- 1)Request Blocks -- 2)Request Packets -- 3)Request Bytes -- 4)Send Acknowledge

### 15.8.220 reg\_ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_bytes\_cnt\_type (ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_bytes\_cnt)—Offset 30708h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_bytes\_cnt:**  
[ISPMMADR] + 30708h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_MemCopy_FSM_Sync_bytes_cnt:</b> Unused
15:0	0h RO	<b>MemCopy_FSM_Sync_bytes_cnt:</b> FSM Synchronization bytes counter: counts the number of bytes received and packed

### 15.8.221 reg\_ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_token\_cnt\_type (ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_token\_cnt)—Offset 3070Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_FSM\_Sync\_token\_cnt:**  
[ISPMMADR] + 3070Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_MemCopy_FSM_Sync_token_cnt:</b> Unused
15:0	0h RO	<b>MemCopy_FSM_Sync_token_cnt:</b> FSM Synchronization token amount: counts the number of token processed

### 15.8.222 reg\_ifmt\_mem\_cpy\_MemCopy\_FSM\_Pack\_idx\_cnt\_type (ifmt\_mem\_cpy\_MemCopy\_FSM\_Pack\_idx\_cnt)—Offset 30710h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_FSM\_Pack\_idx\_cnt:** [ISPMADR] + 30710h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_FSM\_Buf\_Sup\_cnt:** [ISPMMADR]  
+ 30718h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MemCopy_FSM_Buf_Sup_cnt:</b> Unused
0	0h RO	<b>MemCopy_FSM_Buf_Sup_cnt:</b> FSM Buffer support: counter for buffer index

### 15.8.225 reg\_ifmt\_mem\_cpy\_MemCopy\_FSM\_CioWr\_status\_type (ifmt\_mem\_cpy\_MemCopy\_FSM\_CioWr\_status)—Offset 3071Ch

FSM CioWr Status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_mem\_cpy\_MemCopy\_FSM\_CioWr\_status:** [ISPMMADR]  
+ 3071Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000004h

Bit Range	Default & Access	Description
31:0	0h RO	<b>MemCopy_FSM_CioWr_addr:</b> FSM CioWr: write address in byte

### 15.8.227 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg0\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg0)—Offset 30800h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg0:** [ISPMADDR] + 30800h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>IFMT_input_switch_lut_reg0:</b> GP reg input switch data and hsync look-up table Register 0

### 15.8.228 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg1\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg1)—Offset 30804h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg1:** [ISPMMADR] + 30804h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>IFMT_input_switch_lut_reg1:</b> GP reg input switch data and hsync look-up table Register 1

### 15.8.229 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg2\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg2)—Offset 30808h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg2:** [ISPMMADR] + 30808h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>IFMT_input_switch_lut_reg2:</b> GP reg input switch data and hsync look-up table Register 2

### 15.8.230 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg3\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg3)—Offset 3080Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg3:** [ISPMADR] + 3080Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>IFMT_input_switch_lut_reg3:</b> GP reg input switch data and hsync look-up table Register 3

### 15.8.231 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg4\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg4)—Offset 30810h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg4:** [ISPMADR] + 30810h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	<b>IFMT_input_switch_lut_reg4:</b> GP reg input switch data and hsync look-up table Register 4

### 15.8.232 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg5\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg5)—Offset 30814h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_lut\_reg5:** [ISPMMADR] + 30814h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_IFMT_slv_reg_srst												mem_cpy	sec_ift	prim_ift_b	prim_ift_a								

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_IFMT_slv_reg_srst:</b> Unused
3	0h RW	<b>mem_cpy:</b> Soft resets slave registers of mem copy
2	0h RW	<b>sec_ift:</b> Soft resets slave registers of secondary input formatter
1	0h RW	<b>prim_ift_b:</b> Soft resets slave registers of primary input formatter B
0	0h RW	<b>prim_ift_a:</b> Soft resets slave registers of primary input formatter A

### 15.8.238 reg\_ifmt\_gp\_reg\_IFMT\_input\_switch\_ch\_id\_fmt\_type\_type (ifmt\_gp\_reg\_IFMT\_input\_switch\_ch\_id\_fmt\_type)—Offset 3082Ch

GP reg input switch status register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_gp\_reg\_IFMT\_input\_switch\_ch\_id\_fmt\_type:** [ISPMMADR] + 3082Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IFMT_input_switch_ch_id_fmt_type							ch_id	fmt_type

Bit Range	Default & Access	Description
31:7	0h RW	<b>unused_IFMT_input_switch_ch_id_fmt_type:</b> Unused
6:5	0h RO	<b>ch_id:</b> Returns the channel id as it arrives at the input of the input switch
4:0	0h RO	<b>fmt_type:</b> Returns the format type as it arrives at the input of the input switch

### 15.8.239 reg\_ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_edge\_type (ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_edge)—Offset 30A00h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_edge:** [ISPMMADR] + 30A00h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IFMT_IRQ_ctrl_edge								IFMT_IRQ_ctrl_edge

Bit Range	Default & Access	Description
31:5	0h RW	<b>unused_IFMT_IRQ_ctrl_edge:</b> Unused
4:0	0h RW	<b>IFMT_IRQ_ctrl_edge:</b> indicates for each irq bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

### 15.8.240 reg\_ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_mask\_type (ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_mask) –Offset 30A04h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_mask:** [ISPMADDR] + 30A04h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_IFMT_IRQ_ctrl_mask								IFMT_IRQ_ctrl_mask

Bit Range	Default & Access	Description
31:5	0h RW	<b>unused_IFMT_IRQ_ctrl_mask:</b> Unused
4:0	0h RW	<b>IFMT_IRQ_ctrl_mask:</b> indicates for each irq bit whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

### 15.8.241 reg\_ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_status\_type (ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_status)—Offset 30A08h

IRQ controller STATUS

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_status:** [ISPMADDR] + 30A08h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
								sb_changed_irq_stat
								memcpy_irq_stat
								ift_sec_irq_stat
								ift_prim_b_irq_stat
								ift_prim_irq_stat

Bit Range	Default & Access	Description
31:5	0h RW	<b>unused_IFMT_IRQ_ctrl_status:</b> Unused
4	0h RO	<b>sb_changed_irq_stat:</b> Returns the status of the irq signal indicating a change in either the channel id or the format type
3	0h RO	<b>memcpy_irq_stat:</b> Returns the status of the irq generated by the stream to memory device
2	0h RO	<b>ift_sec_irq_stat:</b> Returns the status of the irq generated by the secondary input formatter
1	0h RO	<b>ift_prim_b_irq_stat:</b> Returns the status of the irq generated by the primary input formatter b
0	0h RO	<b>ift_prim_irq_stat:</b> Returns the status of the irq generated by the primary input formatter

### 15.8.242 reg\_ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_clear\_type (ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_clear)—Offset 30A0Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_clear:** [ISPMADDR] + 30A0Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:5	0h RW	<b>unused_IFMT_IRQ_ctrl_clear:</b> Unused
4:0	0h WO	<b>IFMT_IRQ_ctrl_clear:</b> Clears (set to '0') bits in IFMT_IRQ_ctrl_status. When writing a '1' into a bit of this register, the corresponding bit in the IFMT_IRQ_ctrl_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the IFMT_IRQ_ctrl_status is not affected.

### 15.8.243 reg\_ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_enable\_type (ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_enable)—Offset 30A10h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_enable:** [ISPMMADR] + 30A10h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:5	0h RW	<b>unused_IFMT_IRQ_ctrl_enable:</b> Unused
4:0	0h RW	<b>IFMT_IRQ_ctrl_enable:</b> Indicates for each bit whether an interrupt cause as monitored by the IFMT_IRQ_ctrl_status register also affects the IRQ pin (value='1') or not (value='0')

### 15.8.244 reg\_ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_edge\_pulse\_type (ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_edge\_pulse)—Offset 30A14h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ifmt\_irq\_ctrl\_IFMT\_IRQ\_ctrl\_edge\_pulse:** [ISPMADDR] + 30A14h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

### 15.8.331 reg\_isp\_dma\_DMA\_CH22\_dev\_stride\_A\_type (isp\_dma\_DMA\_CH22\_dev\_stride\_A)—Offset 412C0h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isp\_dma\_DMA\_CH22\_dev\_stride\_A:** [ISPMMADR] + 412C0h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH22_dev_stride_A:</b> DMA CH 22 PARAM 1: Device A stride

### 15.8.332 reg\_isp\_dma\_DMA\_CH23\_dev\_stride\_A\_type (isp\_dma\_DMA\_CH23\_dev\_stride\_A)—Offset 412C4h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isp\_dma\_DMA\_CH23\_dev\_stride\_A:** [ISPMMADR] + 412C4h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH23_dev_stride_A:</b> DMA CH 23 PARAM 1: Device A stride

### 15.8.333 reg\_isp\_dma\_DMA\_CH24\_dev\_stride\_A\_type (isp\_dma\_DMA\_CH24\_dev\_stride\_A)—Offset 412C8h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isp\_dma\_DMA\_CH24\_dev\_stride\_A:** [ISPMMADR] + 412C8h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH24_dev_stride_A:</b> DMA CH 24 PARAM 1: Device A stride

### 15.8.334 reg\_isp\_dma\_DMA\_CH25\_dev\_stride\_A\_type (isp\_dma\_DMA\_CH25\_dev\_stride\_A)—Offset 412CCh

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH25\_dev\_stride\_A:** [ISPMADR] + 412CCh

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH25_dev_stride_A:</b> DMA CH 25 PARAM 1: Device A stride

### 15.8.335 reg\_isp\_dma\_DMA\_CH26\_dev\_stride\_A\_type (isp\_dma\_DMA\_CH26\_dev\_stride\_A)—Offset 412D0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH26\_dev\_stride\_A:** [ISPMMADR] + 412D0h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH26_dev_stride_A:</b> DMA CH 26 PARAM 1: Device A stride

### 15.8.336 **reg\_isp\_dma\_DMA\_CH27\_dev\_stride\_A\_type** (isp\_dma\_DMA\_CH27\_dev\_stride\_A)—Offset 412D4h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH27\_dev\_stride\_A:** [ISPMMADR] + 412D4h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH27_dev_stride_A:</b> DMA CH 27 PARAM 1: Device A stride

### 15.8.337 reg\_ism\_dma\_DMA\_CH28\_dev\_stride\_A\_type (isp\_dma\_DMA\_CH28\_dev\_stride\_A)—Offset 412D8h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH28\_dev\_stride\_A:** [ISPMADDR] + 412D8h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

unused_DMA_CH12_Device_Xb_A				DMA_CH12_Device_Xb_A				

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH12_Device_Xb_A:</b> Unused
15:0	0h RO	<b>DMA_CH12_Device_Xb_A:</b> DMA CH 12 PARAM 3: Device A block width (Xb)

### 15.8.354 reg\_isp\_dma\_DMA\_CH13\_Device\_Xb\_A\_type (isp\_dma\_DMA\_CH13\_Device\_Xb\_A)—Offset 41334h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH13\_Device\_Xb\_A:** [ISPMMADR] + 41334h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH13_Device_Xb_A:</b> Unused
15:0	0h RO	<b>DMA_CH13_Device_Xb_A:</b> DMA CH 13 PARAM 3: Device A block width (Xb)

### 15.8.355 reg\_isp\_dma\_DMA\_CH14\_Device\_Xb\_A\_type (isp\_dma\_DMA\_CH14\_Device\_Xb\_A)—Offset 41338h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH14\_Device\_Xb\_A:** [ISPMADDR] + 41338h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH14_Device_Xb_A:</b> Unused

Bit Range	Default & Access	Description
15:0	0h RO	<b>DMA_CH14_Device_Xb_A:</b> DMA CH 14 PARAM 3: Device A block width (Xb)

### 15.8.356 reg\_isp\_dma\_DMA\_CH15\_Device\_Xb\_A\_type (isp\_dma\_DMA\_CH15\_Device\_Xb\_A)—Offset 4133Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH15\_Device\_Xb\_A:** [ISPMMADR] + 4133Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH15_Device_Xb_A:</b> Unused
15:0	0h RO	<b>DMA_CH15_Device_Xb_A:</b> DMA CH 15 PARAM 3: Device A block width (Xb)

### 15.8.357 reg\_isp\_dma\_DMA\_CH16\_Device\_Xb\_A\_type (isp\_dma\_DMA\_CH16\_Device\_Xb\_A)—Offset 41340h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH16\_Device\_Xb\_A:** [ISPMMADR] + 41340h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH16_Device_Xb_A:</b> Unused
15:0	0h RO	<b>DMA_CH16_Device_Xb_A:</b> DMA CH 16 PARAM 3: Device A block width (Xb)

### 15.8.358 reg\_isp\_dma\_DMA\_CH17\_Device\_Xb\_A\_type (isp\_dma\_DMA\_CH17\_Device\_Xb\_A)—Offset 41344h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH17\_Device\_Xb\_A:** [ISPMADR] + 41344h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

31:0	0h RO	<b>DMA_CH6_dev_stride_B:</b> DMA CH 6 PARAM 4: Device B stride

### 15.8.380 reg\_isp\_dma\_DMA\_CH7\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH7\_dev\_stride\_B)—Offset 4141Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH7\_dev\_stride\_B:** [ISPMMADR] + 4141Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH7_dev_stride_B:</b> DMA CH 7 PARAM 4: Device B stride

### 15.8.381 reg\_isp\_dma\_DMA\_CH8\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH8\_dev\_stride\_B)—Offset 41420h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH8\_dev\_stride\_B:** [ISPMMADR] + 41420h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH8_dev_stride_B:</b> DMA CH 8 PARAM 4: Device B stride

### 15.8.382 reg\_ism\_dma\_DMA\_CH9\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH9\_dev\_stride\_B)—Offset 41424h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH9\_dev\_stride\_B:** [ISPMADR] + 41424h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH9_dev_stride_B:</b> DMA CH 9 PARAM 4: Device B stride

### 15.8.383 reg\_ism\_dma\_DMA\_CH10\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH10\_dev\_stride\_B)—Offset 41428h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH10\_dev\_stride\_B:** [ISPMADR] + 41428h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH10_dev_stride_B:</b> DMA CH 10 PARAM 4: Device B stride

### 15.8.384 reg\_isp\_dma\_DMA\_CH11\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH11\_dev\_stride\_B)—Offset 4142Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH11\_dev\_stride\_B:** [ISPMMADR] + 4142Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH11_dev_stride_B:</b> DMA CH 11 PARAM 4: Device B stride

### 15.8.385 reg\_isp\_dma\_DMA\_CH12\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH12\_dev\_stride\_B)—Offset 41430h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH12\_dev\_stride\_B:** [ISPMMADR] + 41430h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH12_dev_stride_B:</b> DMA CH 12 PARAM 4: Device B stride

### 15.8.386 reg\_isp\_dma\_DMA\_CH13\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH13\_dev\_stride\_B)—Offset 41434h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isp\_dma\_DMA\_CH13\_dev\_stride\_B:** [ISPMADR] + 41434h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH13_dev_stride_B:</b> DMA CH 13 PARAM 4: Device B stride

### 15.8.387 reg\_isp\_dma\_DMA\_CH14\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH14\_dev\_stride\_B)—Offset 41438h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isp\_dma\_DMA\_CH14\_dev\_stride\_B:** [ISPMADR] + 41438h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH14_dev_stride_B:</b> DMA CH 14 PARAM 4: Device B stride

### 15.8.388 reg\_isp\_dma\_DMA\_CH15\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH15\_dev\_stride\_B)—Offset 4143Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH15\_dev\_stride\_B:** [ISPMMADR] + 4143Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH15_dev_stride_B:</b> DMA CH 15 PARAM 4: Device B stride

### 15.8.389 reg\_isp\_dma\_DMA\_CH16\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH16\_dev\_stride\_B)—Offset 41440h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH16\_dev\_stride\_B:** [ISPMMADR] + 41440h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH16_dev_stride_B:</b> DMA CH 16 PARAM 4: Device B stride

### 15.8.390 reg\_isp\_dma\_DMA\_CH17\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH17\_dev\_stride\_B)—Offset 41444h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH17\_dev\_stride\_B:** [ISPMADR] + 41444h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH17_dev_stride_B:</b> DMA CH 17 PARAM 4: Device B stride

### 15.8.391 reg\_isp\_dma\_DMA\_CH18\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH18\_dev\_stride\_B)—Offset 41448h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH18\_dev\_stride\_B:** [ISPMMADR] + 41448h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH18_dev_stride_B:</b> DMA CH 18 PARAM 4: Device B stride

### 15.8.392 **reg\_isp\_dma\_DMA\_CH19\_dev\_stride\_B\_type** (**isp\_dma\_DMA\_CH19\_dev\_stride\_B**)—Offset 4144Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH19\_dev\_stride\_B:** [ISPMMADR] + 4144Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH19_dev_stride_B:</b> DMA CH 19 PARAM 4: Device B stride

### 15.8.393 reg\_isp\_dma\_DMA\_CH20\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH20\_dev\_stride\_B)—Offset 41450h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH20\_dev\_stride\_B:** [ISPMADDR] + 41450h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH20_dev_stride_B:</b> DMA CH 20 PARAM 4: Device B stride

### 15.8.394 reg\_isp\_dma\_DMA\_CH21\_dev\_stride\_B\_type (isp\_dma\_DMA\_CH21\_dev\_stride\_B)—Offset 41454h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH21\_dev\_stride\_B:** [ISPMADDR] + 41454h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH21_dev_stride_B</b> : DMA CH 21 PARAM 4: Device B stride

### 15.8.395 **reg\_isp\_dma\_DMA\_CH22\_dev\_stride\_B\_type** (**isp\_dma\_DMA\_CH22\_dev\_stride\_B**)—Offset 41458h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH22\_dev\_stride\_B:** [ISPMMADR] + 41458h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH2\_Yb:** [ISPMADDR] + 41708h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH2_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH2_Yb:</b> DMA CH 2 PARAM 7: block Height (Yb)

### 15.8.470 reg\_isp\_dma\_DMA\_CH3\_Yb\_type (isp\_dma\_DMA\_CH3\_Yb)— Offset 4170Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH3\_Yb:** [ISPMMDR] + 4170Ch

**ISPMMDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH3_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH3_Yb:</b> DMA CH 3 PARAM 7: block Height (Yb)

### 15.8.471 reg\_isp\_dma\_DMA\_CH4\_Yb\_type (isp\_dma\_DMA\_CH4\_Yb)— Offset 41710h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH4\_Yb:** [ISPMMDR] + 41710h

**ISPMMDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH4_Yb</b> : Unused
15:0	0h RO	<b>DMA_CH4_Yb</b> : DMA CH 4 PARAM 7: block Height (Yb)

### 15.8.472 reg\_isp\_dma\_DMA\_CH5\_Yb\_type (isp\_dma\_DMA\_CH5\_Yb)– Offset 41714h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isp\_dma\_DMA\_CH5\_Yb:** [ISPMADR] + 41714h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH5_Yb</b> : Unused
15:0	0h RO	<b>DMA_CH5_Yb</b> : DMA CH 5 PARAM 7: block Height (Yb)

### 15.8.473 reg\_isp\_dma\_DMA\_CH6\_Yb\_type (isp\_dma\_DMA\_CH6\_Yb)– Offset 41718h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH6\_Yb:** [ISPMADDR] + 41718h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH6_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH6_Yb:</b> DMA CH 6 PARAM 7: block Height (Yb)

### 15.8.474 reg\_isp\_dma\_DMA\_CH7\_Yb\_type (isp\_dma\_DMA\_CH7\_Yb)— Offset 4171Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH7\_Yb:** [ISPMADDR] + 4171Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH7_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH7_Yb:</b> DMA CH 7 PARAM 7: block Height (Yb)

### 15.8.475 reg\_isp\_dma\_DMA\_CH8\_Yb\_type (isp\_dma\_DMA\_CH8\_Yb)— Offset 41720h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH8\_Yb:** [ISPMADDR] + 41720h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH8_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH8_Yb:</b> DMA CH 8 PARAM 7: block Height (Yb)

### 15.8.476 reg\_isp\_dma\_DMA\_CH9\_Yb\_type (isp\_dma\_DMA\_CH9\_Yb)— Offset 41724h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH9\_Yb:** [ISPMADDR] + 41724h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH9_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH9_Yb:</b> DMA CH 9 PARAM 7: block Height (Yb)

### 15.8.477 reg\_isp\_dma\_DMA\_CH10\_Yb\_type (isp\_dma\_DMA\_CH10\_Yb)– Offset 41728h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isp\_dma\_DMA\_CH10\_Yb:** [ISPMMADR] + 41728h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_bpp</b> : Unused
3:0	0h RW	<b>bpp</b> : Bits per input/output pixel, allowed: 8, 10, 12, 14

### 15.8.581 reg\_gdc1\_fryipxfrx\_start\_type (gdc1\_fryipxfrx\_start)—Offset 50010h

Fractional component of the starting X and Y position for scaling given in fixed point notation

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_fryipxfrx\_start:** [ISPMADR] + 50010h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:26	0h RW	<b>unused_fryipxfrx_start:</b> Unused
25:16	0h RW	<b>fry:</b> Fractional component of the Y start
15:0	0h RW	<b>ipxfrx:</b> Integer (6) and Fractional (10) component of the X start

### 15.8.582 reg\_gdc1\_oxdim\_type (gdc1\_oxdim)—Offset 50014h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_oxdim:** [ISPMADR] + 50014h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:13	0h RW	<b>unused_oxdim:</b> Unused
12:0	0h RW	<b>oxdim:</b> Output X dimension of the produced block of pixels

### 15.8.583 reg\_gdc1\_oydim\_type (gdc1\_oydim)—Offset 50018h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_oydim:** [ISPMADR] + 50018h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_oydim:</b> Unused
11:0	0h RW	<b>oydim:</b> Output Y dimension of the produced block of pixels

### 15.8.584 reg\_gdc1\_src\_addr\_type (gdc1\_src\_addr)—Offset 5001Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_src\_addr:** [ISPMADR] + 5001Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_src_addr:</b> Unused
24:0	0h RW	<b>src_addr:</b> Source (input) pixel base address [byte-based]

### 15.8.585 reg\_gdc1\_src\_end\_type (gdc1\_src\_end)—Offset 50020h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_src\_end:** [ISPMADR] + 50020h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_src_end</b> : Unused
24:0	0h RW	<b>src_end</b> : End address. When reached wrap around. [byte-based]

### 15.8.586 reg\_gdc1\_src\_wrap\_type (gdc1\_src\_wrap)—Offset 50024h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_src\_wrap:** [ISPMMADR] + 50024h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_src_wrap</b> : Unused
24:0	0h RW	<b>src_wrap</b> : Wrap addr. Wrap here when src_end reached [byte-based]

### 15.8.587 reg\_gdc1\_src\_stride\_type (gdc1\_src\_stride)—Offset 50028h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_src\_stride:** [ISPMMADR] + 50028h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_src_stride:</b> Unused
18:0	0h RW	<b>src_stride:</b> Source (input) pixel stride [byte-based]

### 15.8.588 reg\_gdc1\_dst\_addr\_type (gdc1\_dst\_addr)—Offset 5002Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_dst\_addr:** [ISPMADR] + 5002Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_dst_addr:</b> Unused
24:0	0h RW	<b>dst_addr:</b> Destination (output) pixel base address [byte-based]

### 15.8.589 reg\_gdc1\_dst\_stride\_type (gdc1\_dst\_stride)—Offset 50030h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_dst\_stride:** [ISPMADR] + 50030h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_dst_stride:</b> Unused
18:0	0h RW	<b>dst_stride:</b> Destination (output) pixel stride [byte-based]

### 15.8.590 reg\_gdc1\_dx\_type (gdc1\_dx)—Offset 50034h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_dx:** [ISPMMADR] + 50034h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_dx:</b> Unused
13:0	0h RW	<b>dx:</b> Scaling only: Horizontal scaling factor

### 15.8.591 reg\_gdc1\_dy\_type (gdc1\_dy)—Offset 50038h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_dy:** [ISPMMADR] + 50038h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_dy:</b> Unused
13:0	0h RW	<b>dy:</b> Scaling only: Vertical scaling factor

### 15.8.592 reg\_gdc1\_P0\_primX\_ixdim\_type (gdc1\_P0\_primX\_ixdim)— Offset 5003Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P0\_primX\_ixdim:** [ISPMADR] + 5003Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P0_primX_ixdim:</b> Unused
22:0	0h RW	<b>P0_primX_ixdim:</b> P0(X) Tetragon mode: top-left coordinate (X), Scaling mode: dimension of the input region (X), fixed point notation, 13.10

### 15.8.593 reg\_gdc1\_P0\_primY\_iydim\_type (gdc1\_P0\_primY\_iydim)— Offset 50040h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P0\_primY\_iydim:** [ISPMADR] + 50040h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P0_primY_iydim:</b> Unused
21:0	0h RW	<b>P0_primY_iydim:</b> P0(Y) Tetragon mode: top-left coordinate (Y), Scaling mode: dimension of the input region (Y), fixed point notation, 12.10

### 15.8.594 reg\_gdc1\_P1\_primX\_type (gdc1\_P1\_primX)—Offset 50044h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P1\_primX:** [ISPMADR] + 50044h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P1_primX:</b> Unused
22:0	0h RW	<b>P1_primX:</b> P1(X) Tetragon mode only: top-right coordinate (X), fixed point notation, 13.10

### 15.8.595 reg\_gdc1\_P1\_primY\_type (gdc1\_P1\_primY)—Offset 50048h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P1\_primY:** [ISPMMADR] + 50048h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P1_primY:</b> Unused
21:0	0h RW	<b>P1_primY:</b> P1(Y) Tetragon mode only: top-right coordinate (Y), fixed point notation, 12.10

### 15.8.596 reg\_gdc1\_P2\_primX\_type (gdc1\_P2\_primX)—Offset 5004Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P2\_primX:** [ISPMMADR] + 5004Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P2_primX:</b> Unused
22:0	0h RW	<b>P2_primX:</b> P2(X) Tetragon mode only: bottom-left coordinate (X), fixed point notation, 13.10

### 15.8.597 reg\_gdc1\_P2\_primY\_type (gdc1\_P2\_primY)—Offset 50050h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P2\_primY:** [ISPMMADR] + 50050h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P2_primY:</b> Unused
21:0	0h RW	<b>P2_primY:</b> P2(Y) Tetragon mode only: bottom-left coordinate (Y), fixed point notation, 12.10

### 15.8.598 reg\_gdc1\_P3\_primX\_type (gdc1\_P3\_primX)—Offset 50054h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P3\_primX:** [ISPMMADR] + 50054h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P3_primX:</b> Unused
22:0	0h RW	<b>P3_primX:</b> P3(X) Tetragon mode only: bottom-right coordinate (X), fixed point notation, 13.10

### 15.8.599 reg\_gdc1\_P3\_primY\_type (gdc1\_P3\_primY)—Offset 50058h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_P3\_primY:** [ISPMMADR] + 50058h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P3_primY:</b> Unused
21:0	0h RW	<b>P3_primY:</b> P3(Y) Tetragon mode only: bottom-right coordinate (Y), fixed point notation, 12.10

### 15.8.600 reg\_gdc1\_perf\_mode\_type (gdc1\_perf\_mode)—Offset 5005Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_perf\_mode:** [ISPMMADR] + 5005Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_perf_mode:</b> Unused
1:0	0h RW	<b>perf_mode:</b> Number and location of pixels produced per clock cycle: 00=1x1 pixels ; 01=2x1 pixels ; 10=1x2 pixels ; 11=2x2 pixels

### 15.8.601 reg\_gdc1\_interp\_type\_type (gdc1\_interp\_type)—Offset 50060h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_interp\_type:** [ISPMMADR] + 50060h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_interp_type:</b> Unused
1:0	0h RW	<b>interp_type:</b> Type of interpolation: 00=NND ; 01=BLI ; 10=BCI ; 11=LUT

### 15.8.602 reg\_gdc1\_scan\_mode\_type (gdc1\_scan\_mode)—Offset 50064h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_scan\_mode:** [ISPMMADR] + 50064h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_scan_mode:</b> Unused
0	0h RW	<b>scan_mode:</b> Scanning mode: 0 = STB (Slide To Bottom) ; 1 = STR (Slide To Right)

### 15.8.603 reg\_gdc1\_proc\_mode\_type (gdc1\_proc\_mode)—Offset 50068h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc1\_proc\_mode:** [ISPMMADR] + 50068h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_proc_mode:</b> Unused
0	0h RW	<b>proc_mode:</b> Processing mode: 0 = Rectangular-based scaling ; 1 = Tetragon-based scaling

### 15.8.604 reg\_gdc2\_reg0\_type (gdc2\_reg0)—Offset 60000h

Status register: Current opx, opy, top-level FSM state

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_reg0:** [ISPMMADR] + 60000h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:30	0h RW	<b>unused_reg0:</b> Unused
29:17	0h RO	<b>OPX:</b> OPX value

Bit Range	Default & Access	Description
16:14	0h RO	<b>not_used1:</b> N/A
13:2	0h RO	<b>OPY:</b> OPY value
1:0	0h RO	<b>FSM0_state:</b> FSM0 state: 00=Idle ; 01=Busy-receiving data needed to kick the device ; 10=Busy-wait state ; 11=Busy-run state

### 15.8.605 reg\_gdc2\_woi\_x\_type (gdc2\_woi\_x)—Offset 60004h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_woi\_x:** [ISPMADR] + 60004h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
unused_woi_x				woi_x					

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_woi_x:</b> Unused
11:0	0h RO	<b>woi_x:</b> Configured X dimension of the internal window-of-interest (local memory)

### 15.8.606 reg\_gdc2\_woi\_y\_type (gdc2\_woi\_y)—Offset 60008h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_woi\_y:** [ISPMADR] + 60008h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
unused_woi_y				woi_y					

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_woi_y</b> : Unused
5:0	0h RO	<b>woi_y</b> : Configured Y dimension of the internal window-of-interest (local memory)

### 15.8.607 reg\_gdc2\_bpp\_type (gdc2\_bpp)—Offset 6000Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_bpp:** [ISPMADR] + 6000Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_bpp							bpp	

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_bpp</b> : Unused
3:0	0h RW	<b>bpp</b> : Bits per input/output pixel, allowed: 8, 10, 12, 14

### 15.8.608 reg\_gdc2\_fryipxfrx\_start\_type (gdc2\_fryipxfrx\_start)—Offset 60010h

Fractional component of the starting X and Y position for scaling given in fixed point notation

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_fryipxfrx\_start:** [ISPMADR] + 60010h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:26	0h RW	<b>unused_fryipxfrx_start:</b> Unused
25:16	0h RW	<b>fry:</b> Fractional component of the Y start
15:0	0h RW	<b>ipxfrx:</b> Integer (6) and Fractional (10) component of the X start

### 15.8.609 reg\_gdc2\_oxdim\_type (gdc2\_oxdim)—Offset 60014h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_oxdim:** [ISPMADR] + 60014h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:13	0h RW	<b>unused_oxdim:</b> Unused
12:0	0h RW	<b>oxdim:</b> Output X dimension of the produced block of pixels

### 15.8.610 reg\_gdc2\_oydim\_type (gdc2\_oydim)—Offset 60018h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_oydim:** [ISPMADR] + 60018h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_oydim:</b> Unused
11:0	0h RW	<b>oydim:</b> Output Y dimension of the produced block of pixels

### 15.8.611 reg\_gdc2\_src\_addr\_type (gdc2\_src\_addr)—Offset 6001Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_src\_addr:** [ISPMADR] + 6001Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_src_addr:</b> Unused
24:0	0h RW	<b>src_addr:</b> Source (input) pixel base address [byte-based]

### 15.8.612 reg\_gdc2\_src\_end\_type (gdc2\_src\_end)—Offset 60020h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_src\_end:** [ISPMADR] + 60020h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_src_end</b> : Unused
24:0	0h RW	<b>src_end</b> : End address. When reached wrap around. [byte-based]

### 15.8.613 reg\_gdc2\_src\_wrap\_type (gdc2\_src\_wrap)—Offset 60024h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_src\_wrap:** [ISPMMADR] + 60024h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_src_wrap</b> : Unused
24:0	0h RW	<b>src_wrap</b> : Wrap addr. Wrap here when src_end reached [byte-based]

### 15.8.614 reg\_gdc2\_src\_stride\_type (gdc2\_src\_stride)—Offset 60028h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_src\_stride:** [ISPMMADR] + 60028h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_src_stride:</b> Unused
18:0	0h RW	<b>src_stride:</b> Source (input) pixel stride [byte-based]

### 15.8.615 reg\_gdc2\_dst\_addr\_type (gdc2\_dst\_addr)—Offset 6002Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_dst\_addr:** [ISPMADR] + 6002Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_dst_addr:</b> Unused
24:0	0h RW	<b>dst_addr:</b> Destination (output) pixel base address [byte-based]

### 15.8.616 reg\_gdc2\_dst\_stride\_type (gdc2\_dst\_stride)—Offset 60030h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_dst\_stride:** [ISPMADR] + 60030h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_dst_stride:</b> Unused
18:0	0h RW	<b>dst_stride:</b> Destination (output) pixel stride [byte-based]

### 15.8.617 reg\_gdc2\_dx\_type (gdc2\_dx)—Offset 60034h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_dx:** [ISPMMADR] + 60034h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_dx:</b> Unused
13:0	0h RW	<b>dx:</b> Scaling only: Horizontal scaling factor

### 15.8.618 reg\_gdc2\_dy\_type (gdc2\_dy)—Offset 60038h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_dy:** [ISPMMADR] + 60038h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_dy</b> : Unused
13:0	0h RW	<b>dy</b> : Scaling only: Vertical scaling factor

### 15.8.619 reg\_gdc2\_P0\_primX\_ixdim\_type (gdc2\_P0\_primX\_ixdim)— Offset 6003Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P0\_primX\_ixdim:** [ISPMMADR] + 6003Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P0_primX_ixdim</b> : Unused
22:0	0h RW	<b>P0_primX_ixdim</b> : P0(X) Tetragon mode: top-left coordinate (X), Scaling mode: dimension of the input region (X), fixed point notation, 13.10

### 15.8.620 reg\_gdc2\_P0\_primY\_iydim\_type (gdc2\_P0\_primY\_iydim)— Offset 60040h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P0\_primY\_iydim:** [ISPMMADR] + 60040h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P0_primY_iydim:</b> Unused
21:0	0h RW	<b>P0_primY_iydim:</b> P0(Y) Tetragon mode: top-left coordinate (Y), Scaling mode: dimension of the input region (Y), fixed point notation, 12.10

### 15.8.621 reg\_gdc2\_P1\_primX\_type (gdc2\_P1\_primX)—Offset 60044h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P1\_primX:** [ISPMADR] + 60044h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P1_primX:</b> Unused
22:0	0h RW	<b>P1_primX:</b> P1(X) Tetragon mode only: top-right coordinate (X), fixed point notation, 13.10

### 15.8.622 reg\_gdc2\_P1\_primY\_type (gdc2\_P1\_primY)—Offset 60048h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P1\_primY:** [ISPMMADR] + 60048h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P1_primY:</b> Unused
21:0	0h RW	<b>P1_primY:</b> P1(Y) Tetragon mode only: top-right coordinate (Y), fixed point notation, 12.10

### 15.8.623 reg\_gdc2\_P2\_primX\_type (gdc2\_P2\_primX)—Offset 6004Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P2\_primX:** [ISPMMADR] + 6004Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P2_primX:</b> Unused
22:0	0h RW	<b>P2_primX:</b> P2(X) Tetragon mode only: bottom-left coordinate (X), fixed point notation, 13.10

### 15.8.624 reg\_gdc2\_P2\_primY\_type (gdc2\_P2\_primY)—Offset 60050h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P2\_primY:** [ISPMMADR] + 60050h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P2_primY:</b> Unused
21:0	0h RW	<b>P2_primY:</b> P2(Y) Tetragon mode only: bottom-left coordinate (Y), fixed point notation, 12.10

### 15.8.625 reg\_gdc2\_P3\_primX\_type (gdc2\_P3\_primX)—Offset 60054h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P3\_primX:** [ISPMMADR] + 60054h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:23	0h RW	<b>unused_P3_primX:</b> Unused
22:0	0h RW	<b>P3_primX:</b> P3(X) Tetragon mode only: bottom-right coordinate (X), fixed point notation, 13.10

### 15.8.626 reg\_gdc2\_P3\_primY\_type (gdc2\_P3\_primY)—Offset 60058h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_P3\_primY:** [ISPMMADR] + 60058h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_P3_primY:</b> Unused
21:0	0h RW	<b>P3_primY:</b> P3(Y) Tetragon mode only: bottom-right coordinate (Y), fixed point notation, 12.10

### 15.8.627 reg\_gdc2\_perf\_mode\_type (gdc2\_perf\_mode)—Offset 6005Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_perf\_mode:** [ISPMMADR] + 6005Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_perf_mode:</b> Unused
1:0	0h RW	<b>perf_mode:</b> Number and location of pixels produced per clock cycle: 00=1x1 pixels ; 01=2x1 pixels ; 10=1x2 pixels ; 11=2x2 pixels

### 15.8.628 reg\_gdc2\_interp\_type\_type (gdc2\_interp\_type)—Offset 60060h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_interp\_type:** [ISPMMADR] + 60060h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_interp_type:</b> Unused
1:0	0h RW	<b>interp_type:</b> Type of interpolation: 00=NND ; 01=BLI ; 10=BCI ; 11=LUT

### 15.8.629 reg\_gdc2\_scan\_mode\_type (gdc2\_scan\_mode)—Offset 60064h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_scan\_mode:** [ISPMMADR] + 60064h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_scan_mode:</b> Unused
0	0h RW	<b>scan_mode:</b> Scanning mode: 0 = STB (Slide To Bottom) ; 1 = STR (Slide To Right)

### 15.8.630 reg\_gdc2\_proc\_mode\_type (gdc2\_proc\_mode)—Offset 60068h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gdc2\_proc\_mode:** [ISPMMADR] + 60068h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_proc_mode:</b> Unused
0	0h RW	<b>proc_mode:</b> Processing mode: 0 = Rectangular-based scaling ; 1 = Tetragon-based scaling

### 15.8.631 reg\_data\_out\_sys\_c\_mmu\_MMU\_invalidate\_cache\_type (data\_out\_sys\_c\_mmu\_MMU\_invalidate\_cache)—Offset 70000h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**data\_out\_sys\_c\_mmu\_MMU\_invalidate\_cache:** [ISPMMADR] + 70000h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MMU_invalidate_cache:</b> Unused
0	0h WO	<b>MMU_invalidate_cache:</b> MMU invalidate cache. When '1', the MMUs TLB is invalidated.

### 15.8.632 reg\_data\_out\_sys\_c\_mmu\_MMU\_page\_table\_base\_type (data\_out\_sys\_c\_mmu\_MMU\_page\_table\_base)—Offset 70004h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**data\_out\_sys\_c\_mmu\_MMU\_page\_table\_base:** [ISPMADR] + 70004h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_MMU_page_table_base:</b> Unused
23:0	0h RW	<b>MMU_page_table_base:</b> Defines the physical page number of the page tables

### 15.8.633 reg\_inp\_sys\_csi\_receiver\_csi1\_dev\_ready\_type (inp\_sys\_csi\_receiver\_csi1\_dev\_ready)—Offset 80100h

Set after programming operational registers to enable receiver

#### Access Method

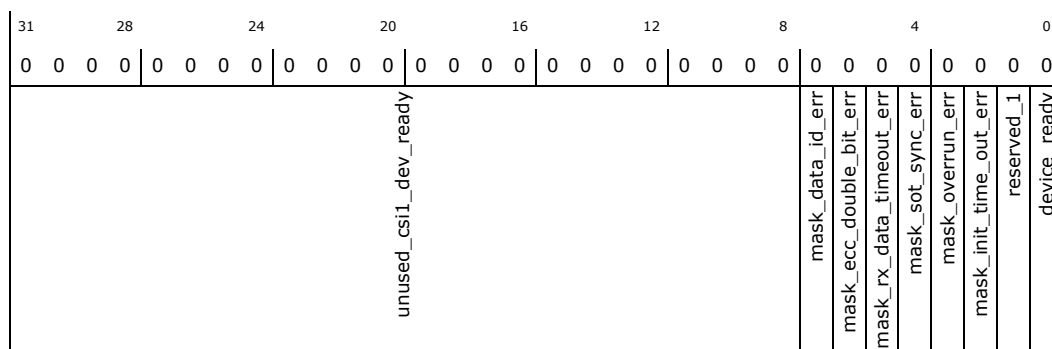

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_dev\_ready:** [ISPMADR] + 80100h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi1_dev_ready:</b> Unused
7	0h RW	<b>mask_data_id_err:</b> Set to mask error recovery when data ID error is detected
6	0h RW	<b>mask_ecc_double_bit_err:</b> Set to mask error recovery when ECC double bit error is detected
5	0h RW	<b>mask_rx_data_timeout_err:</b> Set to mask error recovery when receive data time out error is detected
4	0h RW	<b>mask_sot_sync_err:</b> Set to mask error recovery when start of transmission sync error is detected
3	0h RW	<b>mask_overrun_err:</b> set to mask overrun: NOT used now, can be discarded
2	0h RW	<b>mask_init_time_out_err:</b> Set to mask error recovery when initialization time out error is detected
1	0h RO	<b>reserved_1:</b> Reserved
0	0h RW	<b>device_ready:</b> Set to indicate that device is ready for reception

### 15.8.634 reg\_inp\_sys\_csi\_receiver\_csi1\_int\_status\_type (inp\_sys\_csi\_receiver\_csi1\_int\_status)—Offset 80104h

Interrupt Status

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_int\_status:** [ISPMMADR] + 80104h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:17	0h RW	<b>unused_csi1_int_status:</b> Unused
16	0h RW/1C	<b>err_line_sync:</b> Set if line number for line start and line end packets do not match
15	0h RW/1C	<b>err_escape:</b> Set if an unrecognised escape entry command is received
14	0h RW/1C	<b>err_data_timeout:</b> Set if time taken to receive a packet exceeds programmed timeout value
13	0h RW/1C	<b>err_frame_data:</b> Set if data packets within a frame has errors
12	0h RW/1C	<b>err_frame_sync:</b> Set if frame start is not paired with frame end for same virtual channel
11	0h RW/1C	<b>err_id:</b> Set if packet header has a unrecognised data id
10	0h RW/1C	<b>err_crc:</b> Set if computed CRC differs from received value
9	0h RW/1C	<b>no_ecc_err:</b> Set if no ECC error detected in packet
8	0h RW/1C	<b>err_ecc_corr:</b> Set if ECC error detected and corrected for one bit
7	0h RW/1C	<b>err_ecc_double:</b> Set if ECC error detected for two or more bits
6	0h RW/1C	<b>err_control:</b> Set if DPHY flags a control error
5	0h RW/1C	<b>err_sot_sync_hs:</b> Set if DPHY flags start of transmission synchronisation error
4	0h RW/1C	<b>err_sot_hs:</b> Set if DPHY flags start of transmission error
3	0h RW/1C	<b>sleep_mode_exit:</b> Set if DPHY exits ultra low power state
2	0h RW/1C	<b>sleep_mode_entry:</b> Set if DPHY enters ultra low power state
1	0h RW/1C	<b>err_init_timeout:</b> Set if Initialization timeout error occurs on DPHY data lanes
0	0h RO	<b>reserved_0:</b> Always set to 0

## 15.8.635 reg\_inp\_sys\_csi\_receiver\_csi1\_int\_enable\_type (inp\_sys\_csi\_receiver\_csi1\_int\_enable)—Offset 80108h

Interrupt Enable

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_int\_enable:** [ISPMADR] + 80108h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0												
0	0	0	0	0	0	0	0	0												
unused_csi1_int_enable				err_line_sync	err_escape	err_data_timeout	err_frame_data	err_frame_sync	err_id	err_crc	no_ecc_err	err_ecc_corr	err_ecc_double	err_control	err_sot_sync_hs	err_sot_hs	sleep_mode_exit	sleep_mode_entry	err_init_timeout	overrun

Bit Range	Default & Access	Description
31:17	0h RW	<b>unused_csi1_int_enable:</b> Unused
16	0h RW	<b>err_line_sync:</b> Enable line sync error interrupt
15	0h RW	<b>err_escape:</b> Enable escape entry error interrupt
14	0h RW	<b>err_data_timeout:</b> Enable timeout error interrupt
13	0h RW	<b>err_frame_data:</b> Enable frame data error interrupt
12	0h RW	<b>err_frame_sync:</b> Enable frame sync error interrupt
11	0h RW	<b>err_id:</b> Enable data id error interrupt
10	0h RW	<b>err_crc:</b> Enable CRC error interrupt
9	0h RW	<b>no_ecc_err:</b> Enable no ECC error interrupt
8	0h RW	<b>err_ecc_corr:</b> Enable ECC error detected and corrected for one bit interrupt
7	0h RW	<b>err_ecc_double:</b> Enable ECC error detected for two or more bits interrupt
6	0h RW	<b>err_control:</b> Enable control error interrupt

Bit Range	Default & Access	Description
5	0h RW	<b>err_sot_sync_hs:</b> Enable start of transmission synchronisation error interrupt
4	0h RW	<b>err_sot_hs:</b> Enable start of transmission error interrupt
3	0h RW	<b>sleep_mode_exit:</b> Enable sleep mode exit interrupt
2	0h RW	<b>sleep_mode_entry:</b> Enable sleep mode entry interrupt
1	0h RW	<b>err_init_timeout:</b> Enable Initialization timeout error interrupt
0	0h RW	<b>overrun:</b> Enable FIFO overrun interrupt: NOT available now, can be discarded

### 15.8.636 reg\_inp\_sys\_csi\_receiver\_csi1\_func\_prg\_type (inp\_sys\_csi\_receiver\_csi1\_func\_prg)—Offset 8010Ch

Functional Programming

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_func\_prg:** [ISPMADR] + 8010Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0007FFFFh

31	28	24	20	16	12	8	4	0
0	0	0	0	0	1	1	1	1
0	0	0	0	0	1	1	1	1
0	0	0	0	0	1	1	1	1
0	0	0	0	0	1	1	1	1
unused_csi1_func_prg				func_prg_reg_2	func_prg_reg_1	func_prg_reg_0		

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_csi1_func_prg:</b> Unused
18:16	7h RW	<b>func_prg_reg_2:</b> Byte 2 for functional programming
15:8	FFh RW	<b>func_prg_reg_1:</b> Byte 1 for functional programming
7:0	FFh RW	<b>func_prg_reg_0:</b> Byte 0 for functional programming

### 15.8.637 **reg\_inp\_sys\_csi\_receiver\_csi1\_init\_cnt\_type** (**inp\_sys\_csi\_receiver\_csi1\_init\_cnt**)—Offset 80110h

Duration after power up when DPHY lanes will not be observed

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_init\_cnt:** [ISPMADR] + 80110h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
unused_csi1_init_cnt				init_timer_reg_1				init_timer_reg_0			

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi1_init_cnt:</b> Unused
15:8	0h RW	<b>init_timer_reg_1:</b> Byte 1 for power up timer
7:0	0h RW	<b>init_timer_reg_0:</b> Byte 0 for power up timer

### 15.8.638 **reg\_inp\_sys\_csi\_receiver\_csi\_backend\_fs\_ls\_type** (**inp\_sys\_csi\_receiver\_csi\_backend\_fs\_ls**)—Offset 8011Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_fs\_ls:** [ISPMADR] + 8011Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000002h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_backend_fs_ls</b> : Unused
7:0	02h RW	<b>csi_backend_fs_ls</b> : Minimum interval between frame start and line start syncs

### 15.8.639 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_ls\_dvalid\_type (inp\_sys\_csi\_receiver\_csi\_backend\_ls\_dvalid)—Offset 80120h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_ls\_dvalid:** [ISPMMADR] + 80120h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000002h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_backend_ls_dvalid</b> : Unused
7:0	02h RW	<b>csi_backend_ls_dvalid</b> : Minimum interval between line start sync and valid data

### 15.8.640 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_dvalid\_le\_type (inp\_sys\_csi\_receiver\_csi\_backend\_dvalid\_le)—Offset 80124h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_dvalid\_le:** [ISPMADR] + 80124h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000002h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0

unused\_csi\_backend\_dvalid\_le

csi\_backend\_dvalid\_le

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_backend_dvalid_le:</b> Unused
7:0	02h RW	<b>csi_backend_dvalid_le:</b> Minimum interval between valid data and line end sync

### 15.8.641 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_le\_fe\_type (inp\_sys\_csi\_receiver\_csi\_backend\_le\_fe)—Offset 80128h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_le\_fe:** [ISPMADR] + 80128h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000002h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_backend_le_fe:</b> Unused
7:0	02h RW	<b>csi_backend_le_fe:</b> Minimum interval between line end and frame end syncs

### 15.8.642 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_fe\_fs\_type (inp\_sys\_csi\_receiver\_csi\_backend\_fe\_fs)—Offset 8012Ch

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_fe\_fs:** [ISPMADDR] + 8012Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000002h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_backend_fe_fs:</b> Unused
7:0	02h RW	<b>csi_backend_fe_fs:</b> Minimum interval between frame end and frame start syncs

### 15.8.643 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_le\_ls\_type (inp\_sys\_csi\_receiver\_csi\_backend\_le\_ls)—Offset 80130h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_le\_ls:** [ISPMADR] + 80130h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000004h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_backend_le_ls:</b> Unused
7:0	04h RW	<b>csi_backend_le_ls:</b> Minimum interval between line end and line start syncs

### 15.8.644 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_two\_pixel\_en\_type (inp\_sys\_csi\_receiver\_csi\_backend\_two\_pixel\_en)—Offset 80134h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_two\_pixel\_en:** [ISPMADR] + 80134h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_csi_backend_two_pixel_en: Unused
0	0h RW	csi_backend_two_pixel_en: Enable two pixels per clock mode

#### 15.8.645 reg\_inp\_sys\_csi\_receiver\_csi1\_raw16\_18\_data\_id\_type (inp\_sys\_csi\_receiver\_csi1\_raw16\_18\_data\_id)—Offset 80138h

RAW 16 and RAW 18 data ID register

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_raw16\_18\_data\_id:** [ISPMADR] + 80138h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi1_raw16_18_data_id:</b> Unused
15:14	0h RO	<b>reserved_1514:</b> Reserved
13:8	0h RW	<b>raw18:</b> RAW 18 data ID
7:6	0h RO	<b>reserved_76:</b> Reserved
5:0	0h RW	<b>raw16:</b> RAW 16 data ID

### 15.8.646 **reg\_inp\_sys\_csi\_receiver\_csi1\_sync\_cnt\_type** (**inp\_sys\_csi\_receiver\_csi1\_sync\_cnt**)—Offset 8013Ch

Synchronisation count value in terms of MIPI high speed byte clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_sync\_cnt:** [ISPMADDR] + 8013Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** FFFFFFFFh

Bit Range	Default & Access	Description
31:24	FFh RW	<b>sync_cnt_4lane:</b> Synchronisation count value for 4 lane
23:16	FFh RW	<b>sync_cnt_3lane:</b> Synchronisation count value for 3 lane
15:8	FFh RW	<b>sync_cnt_2lane:</b> Synchronisation count value for 2 lane
7:0	FFh RW	<b>sync_cnt_1lane:</b> Synchronisation count value for 1 lane

### 15.8.647 **reg\_inp\_sys\_csi\_receiver\_csi1\_rx\_cnt\_type** (**inp\_sys\_csi\_receiver\_csi1\_rx\_cnt**)—Offset 80140h

Receive count value in terms of MIPI high speed byte clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi1\_rx\_cnt:** [ISPMADDR] + 80140h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** FFFFFFFFh

31	28	24	20	16	12	8	4	0							
1	1	1	1	1	1	1	1	1							
rx_cnt_4lane				rx_cnt_3lane				rx_cnt_2lane				rx_cnt_1lane			

Bit Range	Default & Access	Description
31:24	FFh RW	<b>rx_cnt_4lane:</b> Receive count value for 4 lane
23:16	FFh RW	<b>rx_cnt_3lane:</b> Receive count value for 3 lane
15:8	FFh RW	<b>rx_cnt_2lane:</b> Receive count value for 2 lane
7:0	FFh RW	<b>rx_cnt_1lane:</b> Receive count value for 1 lane

### 15.8.648 reg\_inp\_sys\_csi\_receiver\_csi\_backend\_rst\_type (inp\_sys\_csi\_receiver\_csi\_backend\_rst)—Offset 80144h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_rst:** [ISPMADDR] + 80144h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_csi_backend_rst								csi_backend_rst

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_csi_backend_rst:</b> Unused

Bit Range	Default & Access	Description
0	0h RW	<b>csi_backend_rst:</b> Reset CSI Rx backend block

### 15.8.649 **reg\_inp\_sys\_csi\_receiver\_csi\_backend\_comp\_pred\_reg0\_vc0\_type** (**inp\_sys\_csi\_receiver\_csi\_backend\_comp\_pred\_reg0\_vc0**)— Offset 80148h

Compression and Prediction scheme register 0 for virtual channel 0

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_backend\_comp\_pred\_reg0\_vc0:**

Bit Range	Default & Access	Description
31:17	0h RW	<b>unused_csi2_int_enable:</b> Unused

Bit Range	Default & Access	Description
16	0h RW	<b>err_line_sync:</b> Enable line sync error interrupt
15	0h RW	<b>err_escape:</b> Enable escape entry error interrupt
14	0h RW	<b>err_data_timeout:</b> Enable timeout error interrupt
13	0h RW	<b>err_frame_data:</b> Enable frame data error interrupt
12	0h RW	<b>err_frame_sync:</b> Enable frame sync error interrupt
11	0h RW	<b>err_id:</b> Enable data id error interrupt
10	0h RW	<b>err_crc:</b> Enable CRC error interrupt
9	0h RW	<b>no_ecc_err:</b> Enable no ECC error interrupt
8	0h RW	<b>err_ecc_corr:</b> Enable ECC error detected and corrected for one bit interrupt
7	0h RW	<b>err_ecc_double:</b> Enable ECC error detected for two or more bits interrupt
6	0h RW	<b>err_control:</b> Enable control error interrupt
5	0h RW	<b>err_sot_sync_hs:</b> Enable start of transmission synchronisation error interrupt
4	0h RW	<b>err_sot_hs:</b> Enable start of transmission error interrupt
3	0h RW	<b>sleep_mode_exit:</b> Enable sleep mode exit interrupt
2	0h RW	<b>sleep_mode_entry:</b> Enable sleep mode entry interrupt
1	0h RW	<b>err_init_timeout:</b> Enable Initialization timeout error interrupt
0	0h RW	<b>overrun:</b> Enable FIFO overrun interrupt: NOT available now, can be discarded

### 15.8.663 **reg\_inp\_sys\_csi\_receiver\_csi2\_func\_prg\_type** (**inp\_sys\_csi\_receiver\_csi2\_func\_prg**)—Offset 8020Ch

Functional Programming

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi2\_func\_prg:** [ISPMADR] + 8020Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0007FFFFh

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_csi2_func_prg:</b> Unused
18:16	7h RW	<b>func_prg_reg_2:</b> Byte 2 for functional programming
15:8	FFh RW	<b>func_prg_reg_1:</b> Byte 1 for functional programming
7:0	FFh RW	<b>func_prg_reg_0:</b> Byte 0 for functional programming

### 15.8.664 reg\_inp\_sys\_csi\_receiver\_csi2\_init\_cnt\_type (inp\_sys\_csi\_receiver\_csi2\_init\_cnt)—Offset 80210h

Duration after power up when DPHY lanes will not be observed

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi2\_init\_cnt:** [ISPMMADR] + 80210h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi2_init_cnt:</b> Unused
15:8	0h RW	<b>init_timer_reg_1:</b> Byte 1 for power up timer

Bit Range	Default & Access	Description
7:0	0h RW	<b>init_timer_reg_0:</b> Byte 0 for power up timer

### 15.8.665 reg\_inp\_sys\_csi\_receiver\_csi2\_raw16\_18\_data\_id\_type (inp\_sys\_csi\_receiver\_csi2\_raw16\_18\_data\_id)—Offset 80238h

RAW 16 and RAW 18 data ID register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi2\_raw16\_18\_data\_id:** [ISPMADR] + 80238h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_csi2_raw16_18_data_id				reserved_1514	raw18	reserved_76	raw16	

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi2_raw16_18_data_id:</b> Unused
15:14	0h RO	<b>reserved_1514:</b> Reserved
13:8	0h RW	<b>raw18:</b> RAW 18 data ID
7:6	0h RO	<b>reserved_76:</b> Reserved
5:0	0h RW	<b>raw16:</b> RAW 16 data ID

### 15.8.666 reg\_inp\_sys\_csi\_receiver\_csi2\_sync\_cnt\_type (inp\_sys\_csi\_receiver\_csi2\_sync\_cnt)—Offset 8023Ch

Synchronisation count value in terms of MIPI high speed byte clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi2\_sync\_cnt:** [ISPMADDR] + 8023Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 000000FFh

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi2_sync_cnt:</b> Unused
7:0	FFh RW	<b>sync_cnt_1lane:</b> Synchronisation count value for 1 lane

### 15.8.667 reg\_inp\_sys\_csi\_receiver\_csi2\_rx\_cnt\_type (inp\_sys\_csi\_receiver\_csi2\_rx\_cnt)—Offset 80240h

Receive count value in terms of MIPI high speed byte clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi2\_rx\_cnt:** [ISPMADDR] + 80240h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 000000FFh

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi2_rx_cnt:</b> Unused
7:0	FFh RW	<b>rx_cnt_1lane:</b> Receive count value for 1 lane

### 15.8.668 reg\_inp\_sys\_csi\_receiver\_csi3\_dev\_ready\_type (inp\_sys\_csi\_receiver\_csi3\_dev\_ready)—Offset 80300h

Set after programming operational registers to enable receiver

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_dev\_ready:** [ISPMADR] + 80300h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
unused_csi3_dev_ready							mask_data_id_err	mask_ecc_double_bit_err	mask_rx_data_timeout_err	mask_sot_sync_err	mask_overrun_err	mask_init_time_out_err	reserved_1	device_ready

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi3_dev_ready:</b> Unused
7	0h RW	<b>mask_data_id_err:</b> Set to mask error recovery when data ID error is detected
6	0h RW	<b>mask_ecc_double_bit_err:</b> Set to mask error recovery when ECC double bit error is detected
5	0h RW	<b>mask_rx_data_timeout_err:</b> Set to mask error recovery when receive data time out error is detected
4	0h RW	<b>mask_sot_sync_err:</b> Set to mask error recovery when start of transmission sync error is detected
3	0h RW	<b>mask_overrun_err:</b> set to mask overrun: NOT used now, can be discarded
2	0h RW	<b>mask_init_time_out_err:</b> Set to mask error recovery when initialization time out error is detected
1	0h RO	<b>reserved_1:</b> Reserved
0	0h RW	<b>device_ready:</b> Set to indicate that device is ready for reception

### 15.8.669 reg\_inp\_sys\_csi\_receiver\_csi3\_int\_status\_type (inp\_sys\_csi\_receiver\_csi3\_int\_status)—Offset 80304h

Interrupt Status

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_int\_status:** [ISPMADDR] + 80304h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0												
0	0	0	0	0	0	0	0	0												
unused_csi3_int_status				err_line_sync	err_escape	err_data_timeout	err_frame_data	err_frame_sync	err_id	err_crc	no_ecc_err	err_ecc_corr	err_ecc_double	err_control	err_sot_sync_hs	err_sot_hs	sleep_mode_exit	sleep_mode_entry	err_init_timeout	reserved_10

Bit Range	Default & Access	Description
31:17	0h RW	<b>unused_csi3_int_status:</b> Unused
16	0h RW/1C	<b>err_line_sync:</b> Set if line number for line start and line end packets do not match
15	0h RW/1C	<b>err_escape:</b> Set if an unrecognised escape entry command is received
14	0h RW/1C	<b>err_data_timeout:</b> Set if time taken to receive a packet exceeds programmed timeout value
13	0h RW/1C	<b>err_frame_data:</b> Set if data packets within a frame has errors
12	0h RW/1C	<b>err_frame_sync:</b> Set if frame start is not paired with frame end for same virtual channel
11	0h RW/1C	<b>err_id:</b> Set if packet header has a unrecognised data id
10	0h RW/1C	<b>err_crc:</b> Set if computed CRC differs from received value
9	0h RW/1C	<b>no_ecc_err:</b> Set if no ECC error detected in packet
8	0h RW/1C	<b>err_ecc_corr:</b> Set if ECC error detected and corrected for one bit
7	0h RW/1C	<b>err_ecc_double:</b> Set if ECC error detected for two or more bits
6	0h RW/1C	<b>err_control:</b> Set if DPHY flags a control error
5	0h RW/1C	<b>err_sot_sync_hs:</b> Set if DPHY flags start of transmission synchronisation error
4	0h RW/1C	<b>err_sot_hs:</b> Set if DPHY flags start of transmission error
3	0h RW/1C	<b>sleep_mode_exit:</b> Set if DPHY exits ultra low power state

Bit Range	Default & Access	Description
2	0h RW/1C	<b>sleep_mode_entry:</b> Set if DPHY enters ultra low power state
1	0h RW/1C	<b>err_init_timeout:</b> Set if Initialization timeout error occurs on DPHY data lanes
0	0h RO	<b>reserved_10:</b> Always set to 0

### 15.8.670 reg\_inp\_sys\_csi\_receiver\_csi3\_int\_enable\_type (inp\_sys\_csi\_receiver\_csi3\_int\_enable)—Offset 80308h

Interrupt Enable

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_int\_enable:** [ISPMADDR] + 80308h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0												
0	0	0	0	0	0	0	0	0												
unused_csi3_int_enable				err_line_sync	err_escape	err_data_timeout	err_frame_data	err_frame_sync	err_id	err_crc	no_ecc_err	err_ecc_corr	err_ecc_double	err_control	err_sot_sync_hs	err_sot_hs	sleep_mode_exit	sleep_mode_entry	err_init_timeout	overrun

Bit Range	Default & Access	Description
31:17	0h RW	<b>unused_csi3_int_enable:</b> Unused
16	0h RW	<b>err_line_sync:</b> Enable line sync error interrupt
15	0h RW	<b>err_escape:</b> Enable escape entry error interrupt
14	0h RW	<b>err_data_timeout:</b> Enable timeout error interrupt
13	0h RW	<b>err_frame_data:</b> Enable frame data error interrupt
12	0h RW	<b>err_frame_sync:</b> Enable frame sync error interrupt
11	0h RW	<b>err_id:</b> Enable data id error interrupt
10	0h RW	<b>err_crc:</b> Enable CRC error interrupt

Bit Range	Default & Access	Description
9	0h RW	<b>no_ecc_err:</b> Enable no ECC error interrupt
8	0h RW	<b>err_ecc_corr:</b> Enable ECC error detected and corrected for one bit interrupt
7	0h RW	<b>err_ecc_double:</b> Enable ECC error detected for two or more bits interrupt
6	0h RW	<b>err_control:</b> Enable control error interrupt
5	0h RW	<b>err_sot_sync_hs:</b> Enable start of transmission synchronisation error interrupt
4	0h RW	<b>err_sot_hs:</b> Enable start of transmission error interrupt
3	0h RW	<b>sleep_mode_exit:</b> Enable sleep mode exit interrupt
2	0h RW	<b>sleep_mode_entry:</b> Enable sleep mode entry interrupt
1	0h RW	<b>err_init_timeout:</b> Enable Initialization timeout error interrupt
0	0h RW	<b>overrun:</b> Enable FIFO overrun interrupt: NOT available now, can be discarded

### 15.8.671 **reg\_inp\_sys\_csi\_receiver\_csi3\_func\_prg\_type** (**inp\_sys\_csi\_receiver\_csi3\_func\_prg**)—Offset 8030Ch

Functional Programming

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_func\_prg:** [ISPMADDR] + 8030Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0007FFFFh

31	28	24	20	16	12	8	4	0
0	0	0	0	0	1	1	1	1

0	0	0	0	0	1	1	1	1
unused_csi3_func_prg				func_prg_reg_2	func_prg_reg_1	func_prg_reg_0		

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_csi3_func_prg:</b> Unused

Bit Range	Default & Access	Description
18:16	7h RW	<b>func_prg_reg_2:</b> Byte 2 for functional programming
15:8	FFh RW	<b>func_prg_reg_1:</b> Byte 1 for functional programming
7:0	FFh RW	<b>func_prg_reg_0:</b> Byte 0 for functional programming

### 15.8.672 reg\_inp\_sys\_csi\_receiver\_csi3\_init\_cnt\_type (inp\_sys\_csi\_receiver\_csi3\_init\_cnt)—Offset 80310h

Duration after power up when DPHY lanes will not be observed

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_init\_cnt:** [ISPMADR] + 80310h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi3_init_cnt:</b> Unused
15:8	0h RW	<b>init_timer_reg_1:</b> Byte 1 for power up timer
7:0	0h RW	<b>init_timer_reg_0:</b> Byte 0 for power up timer

### 15.8.673 reg\_inp\_sys\_csi\_receiver\_csi3\_raw16\_18\_data\_id\_type (inp\_sys\_csi\_receiver\_csi3\_raw16\_18\_data\_id)—Offset 80338h

RAW 16 and RAW 18 data ID register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_raw16\_18\_data\_id:** [ISPMMADR]  
+ 80338h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi3_raw16_18_data_id:</b> Unused
15:14	0h RO	<b>reserved_1514:</b> Reserved
13:8	0h RW	<b>raw18:</b> RAW 18 data ID
7:6	0h RO	<b>reserved_76:</b> Reserved
5:0	0h RW	<b>raw16:</b> RAW 16 data ID

### 15.8.674 reg\_inp\_sys\_csi\_receiver\_csi3\_sync\_cnt\_type (inp\_sys\_csi\_receiver\_csi3\_sync\_cnt)—Offset 8033Ch

Synchronisation count value in terms of MIPI high speed byte clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_sync\_cnt:** [ISPMMADR] + 8033Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000FFFFh

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi3_sync_cnt:</b> Unused
15:8	FFh RW	<b>sync_cnt_2lane:</b> Synchronisation count value for 2 lane
7:0	FFh RW	<b>sync_cnt_1lane:</b> Synchronisation count value for 1 lane

### 15.8.675 **reg\_inp\_sys\_csi\_receiver\_csi3\_rx\_cnt\_type** (**inp\_sys\_csi\_receiver\_csi3\_rx\_cnt**)—Offset 80340h

Receive count value in terms of MIPI high speed byte clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi3\_rx\_cnt:** [ISPMADDR] + 80340h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_csi3_rx_cnt:</b> Unused
15:8	0h RW	<b>rx_cnt_2lane:</b> Receive count value for 2 lane
7:0	0h RW	<b>rx_cnt_1lane:</b> Receive count value for 1 lane

### 15.8.676 reg\_inp\_sys\_csi\_receiver\_csi\_be\_gen\_sh\_acc\_ovl\_type (inp\_sys\_csi\_receiver\_csi\_be\_gen\_sh\_acc\_ovl)—Offset 80800h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_be\_gen\_sh\_acc\_ovl:** [ISPMMADR]  
+ 80800h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_csi_be_gen_sh_acc_ovl:</b> Unused
0	0h RW	<b>csi_be_gen_sh_acc_ovl:</b> Allows for overruling the accept signal generated by the generic short packet FIFO, going to the CSI receiver backend.

### 15.8.677 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_srst\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_srst)—Offset 80804h

soft reset modules of the SH CSI receiver Back End

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_srst:** [ISPMMADR] + 80804h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_sh_be_srst:</b> Unused
7	0h RW	<b>srst_be_controller:</b> Soft resets the backend controller module
6	0h RW	<b>srst_one_2_two_channel:</b> Soft resets the one 2 two channel module
5	0h RW	<b>srst_stream_demux:</b> Soft resets the stream demux module
4	0h RW	<b>srst_pixel_decoder:</b> Soft resets the pixel decoder module
3	0h RW	<b>srst_stream_mux:</b> Soft resets the stream mux module
2	0h RW	<b>srst_pixel_formatter:</b> Soft resets the pixel formatter module
1	0h RW	<b>srst_rate_conversion_fifo:</b> Soft resets the rate conversion FIFO module
0	0h RW	<b>srst_header_extractor:</b> Soft resets the header extractor module

### 15.8.678 **reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_two\_ppc\_type** (**inp\_sys\_csi\_receiver\_csi\_sh\_be\_two\_ppc**)—Offset 80808h

Sets the output rate of the backend and the precision

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_two\_ppc:** [ISPMADR] + 80808h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_csi_sh_be_two_ppc:</b> Unused
1	0h RW	<b>high_precision:</b> When '1', (and use_both_ports='1' as well) both ports A and B are used to output one high precision pixel, when '0', high_precision pixels are saturated to fit on one port.
0	0h RW	<b>use_both_ports:</b> When '1', both ports A and B are active. When '0' only port A is active

### 15.8.679 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_comp\_reg\_vc0\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_comp\_reg\_vc0)—Offset 8080Ch

Compression scheme register for virtual channel 0

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_comp\_reg\_vc0:**  
[ISPMADR] + 8080Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31	0h RW	<b>pred_usd_type8:</b> prediction algorithm for vc=0, user defined type 8 data: 0 -) pred1, 1 -) pred2
30:28	0h RW	<b>comp_usd_type8:</b> compression format for vc=0, user defined type 8 data: value between 0 to 6. 0-no compression

Bit Range	Default & Access	Description
27	0h RW	<b>pred_usd_type7:</b> prediction algorithm for vc=0, user defined type 7 data: 0 -) pred1, 1 -) pred2
26:24	0h RW	<b>comp_usd_type7:</b> compression format for vc=0, user defined type 7 data: value between 0 to 6. 0-no compression
23	0h RW	<b>pred_usd_type6:</b> prediction algorithm for vc=0, user defined type 6 data: 0 -) pred1, 1 -) pred2
22:20	0h RW	<b>comp_usd_type6:</b> compression format for vc=0, user defined type 6 data: value between 0 to 6. 0-no compression
19	0h RW	<b>pred_usd_type5:</b> prediction algorithm for vc=0, user defined type 5 data: 0 -) pred1, 1 -) pred2
18:16	0h RW	<b>comp_usd_type5:</b> compression format for vc=0, user defined type 5 data: value between 0 to 6. 0-no compression
15	0h RW	<b>pred_usd_type4:</b> prediction algorithm for vc=0, user defined type 4 data: 0 -) pred1, 1 -) pred2
14:12	0h RW	<b>comp_usd_type4:</b> compression format for vc=0, user defined type 4 data: value between 0 to 6. 0-no compression
11	0h RW	<b>pred_usd_type3:</b> prediction algorithm for vc=0, user defined type 3 data: 0 -) pred1, 1 -) pred2
10:8	0h RW	<b>comp_usd_type3:</b> compression format for vc=0, user defined type 3 data: value between 0 to 6. 0-no compression
7	0h RW	<b>pred_usd_type2:</b> prediction algorithm for vc=0, user defined type 2 data: 0 -) pred1, 1 -) pred2
6:4	0h RW	<b>comp_usd_type2:</b> compression format for vc=0, user defined type 2 data: value between 0 to 6. 0-no compression
3	0h RW	<b>pred_usd_type1:</b> prediction algorithm for vc=0, user defined type 1 data: 0 -) pred1, 1 -) pred2
2:0	0h RW	<b>comp_usd_type1:</b> compression format for vc=0, user defined type 1 data: value between 0 to 6. 0-no compression

### 15.8.680 **reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_comp\_reg\_vc1\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_comp\_reg\_vc1)–Offset 80810h**

Compression scheme register for virtual channel 1

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_comp\_reg\_vc1:**  
[ISPMADR] + 80810h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)  
**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

### 15.8.683 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_sel\_be\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_sel\_be)—Offset 8081Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_sel\_be:** [ISPMADR] + 8081Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_csi_sh_be_sel_be:</b> Unused
0	0h RW	<b>csi_sh_be_sel_be:</b> Selects which CSI Receiver Backend to use 0-Arasan Backend, 1-Silicon Hive Backend

### 15.8.684 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_raw16\_reg\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_raw16\_reg)—Offset 80820h

Configuration register for RAW 16 data type decode

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_raw16\_reg:** [ISPMADR] + 80820h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:7	0h RW	<b>unused_csi_sh_be_raw16_reg:</b> Unused
6	0h RW	<b>format_en:</b> enable RAW 16 type decode
5:0	0h RW	<b>format_id:</b> data id for RAW 16

### 15.8.685 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_raw18\_reg\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_raw18\_reg)—Offset 80824h

Configuration register for RAW 18 data type decode

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_raw18\_reg:** [ISPMADR] + 80824h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:9	0h RW	<b>unused_csi_sh_be_raw18_reg:</b> Unused
8	0h RW	<b>format_en:</b> enable RAW 16 type decode
7:6	0h RW	<b>format_option:</b> format option for RAW 18 data type: 3 options possible (1,2,3)
5:0	0h RW	<b>format_id:</b> data id for RAW 16

### 15.8.686 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_force\_raw8\_reg\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_force\_raw8\_reg)—Offset 80828h

Force RAW8(byte) decoding for LONG data packets

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_force\_raw8\_reg:**  
[ISPMADR] + 80828h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_sh_be_force_raw8_reg:</b> Unused
7:2	0h RW	<b>force_data_id:</b> Data_id that should be forced to RAW8
1:0	0h RW	<b>option_enable:</b> 00-Do not force anything in RAW8 mode. 01-force all data types in RAW8 mode, 11-force only packets with data_id force_data_id to RAW8 mode

### 15.8.687 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_irq\_stat\_reg\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_irq\_stat\_reg)—Offset 8082Ch

IRQ status register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_irq\_stat\_reg:** [ISPMADR] + 8082Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
unused_csi_sh_be_irq_stat_reg								irq_premature_sop	irq_missing_sop

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_csi_sh_be_irq_stat_reg:</b> Unused
1	0h RO	<b>irq_premature_sop:</b> If '1', sh_be has detected a premature sop
0	0h RO	<b>irq_missing_sop:</b> If '1', sh_be has detected a missing sop

### 15.8.688 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_irq\_stat\_clear\_reg\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_irq\_stat\_clear\_reg)—Offset 80830h

IRQ status clear register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_irq\_stat\_clear\_reg:**  
[ISPMADDR] + 80830h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
unused_csi_sh_be_irq_stat_clear_reg								irq_premature_sop	irq_missing_sop

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_csi_sh_be_irq_stat_clear_reg:</b> Unused
1	0h WO	<b>irq_premature_sop:</b> A '1' written into this field, clears the premature_sop field to '0'
0	0h WO	<b>irq_missing_sop:</b> A '1' written into this field, clears the irq_missing_sop field to '0'

### 15.8.689 reg\_inp\_sys\_csi\_receiver\_csi\_sh\_be\_custom\_enable\_reg\_type (inp\_sys\_csi\_receiver\_csi\_sh\_be\_custom\_enable\_reg)—Offset 80834h

Enable custom mode decoding for LONG data packets

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_csi\_receiver\_csi\_sh\_be\_custom\_enable\_reg:**  
[ISPMADDR] + 80834h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:8	0h RW	<b>unused_csi_sh_be_custom_enable_reg:</b> Unused
7:2	0h RW	<b>custom_data_id:</b> Data_id that should be processed in custom mode
1:0	0h RW	<b>option_enable:</b> 00-Custom mode switched off. 01-all data types in custom mode, 11-only packets with data id custom_data_id are processed in custom mode

### 15.8.690 reg\_inp\_sys\_capt\_unit\_a\_reg\_CaptStartMode\_type (inp\_sys\_capt\_unit\_a\_reg\_CaptStartMode)—Offset 81000h

#### Access Method

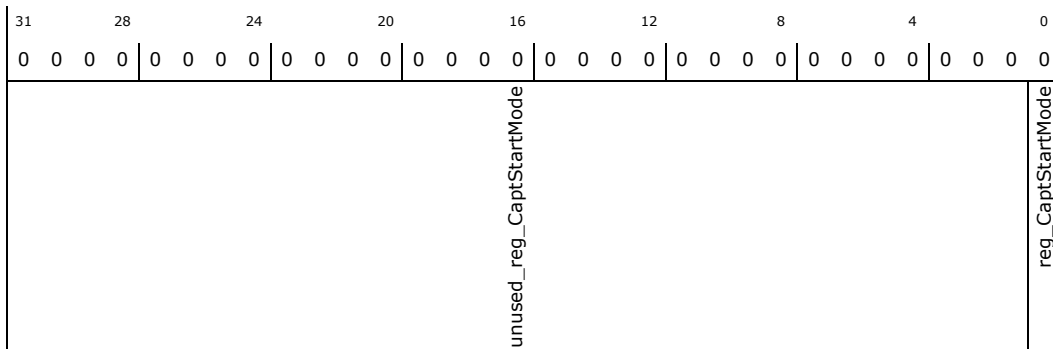

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_CaptStartMode:** [ISPMADDR] + 81000h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_CaptStartMode:</b> Unused
0	0h RW	<b>reg_CaptStartMode:</b> Synchronize on any packet header or on a frame start

### 15.8.691 **reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Start\_Addr\_type** (**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Start\_Addr**)—Offset 81004h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Start\_Addr:** [ISPMADR] + 81004h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_Capt_Start_Addr							reg_Capt_Start_Addr	

Bit Range	Default & Access	Description
31:9	0h RW	<b>unused_reg_Capt_Start_Addr:</b> Unused
8:0	0h RW	<b>reg_Capt_Start_Addr:</b> Start Address of first memory region

### 15.8.692 **reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Mem\_Region\_Size\_type** (**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Mem\_Region\_Size**)—Offset 81008h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Mem\_Region\_Size:** [ISPMADR] + 81008h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000080h

Bit Range	Default & Access	Description
31:9	0h RW	<b>unused_reg_Capt_Mem_Region_Size:</b> Unused
8:0	080h RW	<b>reg_Capt_Mem_Region_Size:</b> Memory region size

### 15.8.693 **reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Num\_Mem\_Regions\_type (inp\_sys\_capt\_unit\_a\_reg\_Capt\_Num\_Mem\_Regions)—Offset 8100Ch**

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Num\_Mem\_Regions:**  
[ISPMADR] + 8100Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000003h

Bit Range	Default & Access	Description
31:9	0h RW	<b>unused_reg_Capt_Num_Mem_Regions:</b> Unused
8:0	003h RW	<b>reg_Capt_Num_Mem_Regions:</b> Number of memory regions

### 15.8.694 reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Init\_type (inp\_sys\_capt\_unit\_a\_reg\_Capt\_Init)—Offset 81010h

Initialize Capture Unit

#### Access Method

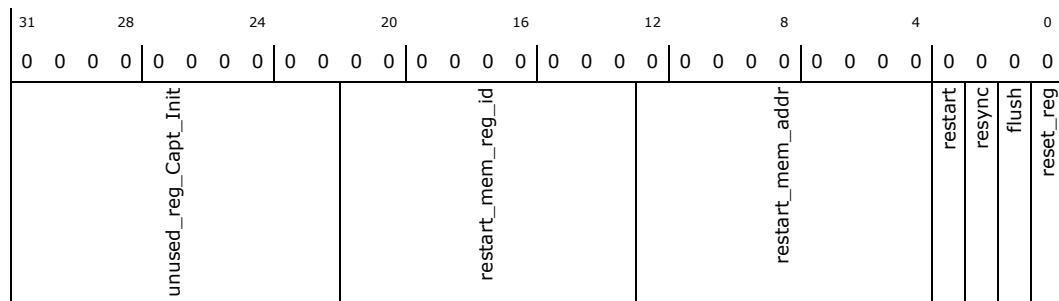

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Init:** [ISPMADDR] + 81010h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:22	0h RW	<b>unused_reg_Capt_Init:</b> Unused
21:13	0h WO	<b>restart_mem_reg_id:</b> Restart Memory Region ID
12:4	0h WO	<b>restart_mem_addr:</b> Restart Memory Address
3	0h WO	<b>restart:</b> Restart Capture Unit
2	0h WO	<b>resync:</b> Resynchronize Capture Unit
1	0h WO	<b>flush:</b> Flush Internal Buffers
0	0h WO	<b>reset_reg:</b> Reset Status Registers

### 15.8.695 reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Start\_type (inp\_sys\_capt\_unit\_a\_reg\_Capt\_Start)—Offset 81014h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Start:** [ISPMADR] + 81014h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_Capt_Start:</b> Unused
0	0h WO	<b>reg_Capt_Start:</b> Start Capturing

### 15.8.696 reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Stop\_type (inp\_sys\_capt\_unit\_a\_reg\_Capt\_Stop)—Offset 81018h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Stop:** [ISPMADR] + 81018h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_Capt_Stop:</b> Unused
0	0h WO	<b>reg_Capt_Stop:</b> Stop Capturing

### 15.8.697 **reg\_inpsyscaptunit\_a\_reg\_Capt\_Packet\_Length\_type** (**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Packet\_Length**)—Offset 8101Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Packet\_Length:**  
[ISPMADDR] + 8101Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>reg_Capt_Packet_Length:</b> Packet length of multi_word packet (MWP) as decoded from packet header

### 15.8.698 **reg\_inpsyscaptunit\_a\_reg\_Capt\_Received\_Length\_type** (**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Received\_Length**)—Offset 81020h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Received\_Length:**  
[ISPMADDR] + 81020h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>reg_Capt_Received_Length:</b> (Incremental) received packet length of current multi-word packet (MWP)

### 15.8.699 **reg\_inp\_sys\_capt\_unit\_a\_reg\_Capt\_Received\_Short\_Packets\_type (inp\_sys\_capt\_unit\_a\_reg\_Capt\_Received\_Short\_Packets)–Offset 81024h**

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_capt\_unit\_a\_reg\_Capt\_Received\_Short\_Packets:**  
[ISPMMADR] + 81024h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH0_Device_Xb_A:</b> Unused
15:0	0h RO	<b>DMA_CH0_Device_Xb_A:</b> DMA CH 0 PARAM 3: Device A block width (Xb)

### 15.8.755 reg\_inp\_sys\_dma\_DMA\_CH0\_dev\_stride\_B\_type (inp\_sys\_dma\_DMA\_CH0\_dev\_stride\_B)—Offset 86400h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_CH0\_dev\_stride\_B:** [ISPMMADR] + 86400h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_CH0_dev_stride_B:</b> DMA CH 0 PARAM 4: Device B stride

### 15.8.756 reg\_inp\_sys\_dma\_DMA\_CH0\_dev\_Pack\_left\_crop\_and\_elem\_B\_type

**(inp\_sys\_dma\_DMA\_CH0\_dev\_Pack\_left\_crop\_and\_elem\_B)—Offset 86500h**

DMA CH 0 PARAM 5: Device B Packing LSE cropping/Elements

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_CH0\_dev\_Pack\_left\_crop\_and\_elem\_B**  
: [ISPMADDR] + 86500h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_DMA_CH0_dev_Pack_left_crop_and_elem_B:</b> Unused
13:8	0h RO	<b>Dev_B_crop:</b> Device B left element cropping
7	0h RO	<b>unused:</b> unused
6:0	0h RO	<b>Dev_B_elem:</b> Device B element per word

**15.8.757 reg\_inp\_sys\_dma\_DMA\_CH0\_Device\_Xb\_B\_type (inp\_sys\_dma\_DMA\_CH0\_Device\_Xb\_B)—Offset 86600h**

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_CH0\_Device\_Xb\_B:** [ISPMADDR] + 86600h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH0_Device_Xb_B:</b> Unused
15:0	0h RO	<b>DMA_CH0_Device_Xb_B:</b> DMA CH 0 PARAM 6: Device B block width (Xb)

### 15.8.758 reg\_inp\_sys\_dma\_DMA\_CH0\_Yb\_type (inp\_sys\_dma\_DMA\_CH0\_Yb)—Offset 86700h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_CH0\_Yb:** [ISPMADDR] + 86700h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_DMA_CH0_Yb:</b> Unused
15:0	0h RO	<b>DMA_CH0_Yb:</b> DMA CH 0 PARAM 7: block Height (Yb)

### 15.8.759 reg\_inp\_sys\_dma\_DMA\_CH0\_pending\_command\_type (inp\_sys\_dma\_DMA\_CH0\_pending\_command)—Offset 86800h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_CH0\_pending\_command:** [ISPMADR] + 86800h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_DMA_CH0_pending_command								DMA_CH0_pending_command

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_DMA_CH0_pending_command:</b> Unused
3:0	0h RO	<b>DMA_CH0_pending_command:</b> DMA CH 0 PARAM 8: Pending commands which will use channel 0

### 15.8.760 reg\_inp\_sys\_dma\_DMA\_command\_token\_type (inp\_sys\_dma\_DMA\_command\_token)—Offset 87000h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_command\_token:** [ISPMADR] + 87000h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_command_token:</b> Pending or last executed command token

### 15.8.761 reg\_inp\_sys\_dma\_DMA\_command\_src\_addr\_type (inp\_sys\_dma\_DMA\_command\_src\_addr)—Offset 87004h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_command\_src\_addr:** [ISPMADR] + 87004h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_command_src_addr:</b> Source address of the pending or last executed command token

### 15.8.762 reg\_inp\_sys\_dma\_DMA\_command\_dst\_addr\_type (inp\_sys\_dma\_DMA\_command\_dst\_addr)—Offset 87008h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_dma\_DMA\_command\_dst\_addr:** [ISPMADR] + 87008h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>DMA_command_dst_addr:</b> Destination address of the pending or last executed command token

### 15.8.763 reg\_inp\_sys\_dma\_DMA\_command\_ctrl\_id\_type (inp\_sys\_dma\_DMA\_command\_ctrl\_id)—Offset 8700Ch

#### Access Method

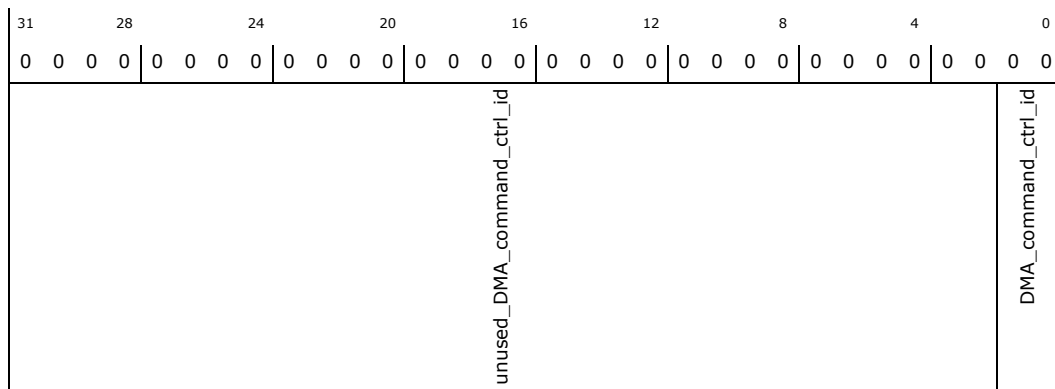

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_dma\_DMA\_command\_ctrl\_id:** [ISPMADR] + 8700Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_DMA_command_ctrl_id:</b> Unused
1:0	0h RO	<b>DMA_command_ctrl_id:</b> Controller id of the pending or last executed command token

### 15.8.764 reg\_inp\_sys\_dma\_DMA\_FSM\_Ctrl\_status\_type (inp\_sys\_dma\_DMA\_FSM\_Ctrl\_status)—Offset 87010h

DMA FSM Control state and flags

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_dma\_DMA\_FSM\_Ctrl\_status:** [ISPMMDR] + 87010h

**ISPMMDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000001h

31:9	0h RW	<b>unused_inpsys_acq_start_addr:</b> Unused
8:0	0h RW	<b>inpsys_acq_start_addr:</b> Input System Controller Acquisition mem region start address

### 15.8.813 reg\_inp\_sys\_inp\_ctrl\_inpsys\_acq\_mem\_region\_size\_type (inp\_sys\_inp\_ctrl\_inpsys\_acq\_mem\_region\_size)—Offset 89028h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inp\_sys\_inp\_ctrl\_inpsys\_acq\_mem\_region\_size:** [ISPMMADR] + 89028h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000080h

Bit Range	Default & Access	Description
31:9	0h RW	unused_inpsys_acq_mem_region_size: Unused
8:0	080h RW	inpsys_acq_mem_region_size: Input System Controller Acquisition mem region size

### 15.8.814 reg\_inp\_sys\_inp\_ctrl\_inpsys\_acq\_num\_mem\_regions\_type (inp\_sys\_inp\_ctrl\_inpsys\_acq\_num\_mem\_regions)—Offset 8902Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_inp\_ctrl\_inpsys\_acq\_num\_mem\_regions:**  
[ISPMMADR] + 8902Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000003h

Bit Range	Default & Access	Description
31:9	0h RW	<b>unused_inpsys_acq_num_mem_regions:</b> Unused
8:0	003h RW	<b>inpsys_acq_num_mem_regions:</b> Input System Controller Acquisition number of mem regions

### 15.8.815 reg\_inp\_sys\_inp\_ctrl\_inpsys\_ctrl\_init\_type (inp\_sys\_inp\_ctrl\_inpsys\_ctrl\_init)—Offset 89030h

Input System Controller initialization register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_inp\_ctrl\_inpsys\_ctrl\_init:** [ISPMADDR] + 89030h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
unused_inpsys_ctrl_init								reserved	reset_registers

Bit Range	Default & Access	Description
31:3	0h RW	<b>unused_inpsys_ctrl_init:</b> Unused
2:1	0h RW	<b>reserved:</b> reserved bits, no action for now
0	0h RW	<b>reset_registers:</b> Reset all registers in Input System Controller

### 15.8.816 reg\_inp\_sys\_inp\_ctrl\_inpsys\_last\_cmd\_type (inp\_sys\_inp\_ctrl\_inpsys\_last\_cmd)—Offset 89034h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_inp\_ctrl\_inpsys\_last\_cmd:** [ISPMADDR] + 89034h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000000Fh

Bit Range	Default & Access	Description
31:0	0000000Fh RO	<b>inpsys_last_cmd</b> : Input System Controller last command register

### 15.8.817 reg\_inpsys\_inpsys\_next\_cmd\_type (inpsys\_inpsys\_next\_cmd)—Offset 89038h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inpsys\_inpsys\_next\_cmd:** [ISPMMADR] + 89038h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000000Fh

Bit Range	Default & Access	Description
31:0	0000000Fh RO	<b>inpsys_next_cmd</b> : Input System Controller next command register

### 15.8.818 reg\_inpsys\_inpsys\_last\_ack\_type (inpsys\_inpsys\_last\_ack)—Offset 8903Ch

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inpsys\_inpsys\_last\_ack:** [ISPMMADR] + 8903Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

inpsys_next_ack								

Bit Range	Default & Access	Description
31:0	000000Fh RO	<b>inpsys_next_ack:</b> Input System Controller next acknowledge register

### 15.8.820 reg\_inpsys\_inpsys\_top\_fsm\_state\_type (inpsys\_inpsys\_top\_fsm\_state)—Offset 89044h

Input System Controller top-ctrl FSM current and next state info Register (both Cmd/Ack FSM)

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**inpsys\_inpsys\_top\_fsm\_state:** [ISPMMADR] + 89044h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
ack_fsm_next_state				ack_fsm_current_state				cmd_fsm_next_state				cmd_fsm_current_state			

Bit Range	Default & Access	Description
31:24	0h RW	<b>ack_fsm_next_state:</b> Next state of top-ctrl Acknowledge FSM
23:16	0h RW	<b>ack_fsm_current_state:</b> Current state of top-ctrl Acknowledge FSM
15:8	0h RW	<b>cmd_fsm_next_state:</b> Next state of top-ctrl Command FSM
7:0	0h RW	<b>cmd_fsm_current_state:</b> Current state of top-ctrl Command FSM

### 15.8.821 reg\_inp\_sys\_inp\_ctrl\_inpsys\_captA\_fsm\_state\_type (inp\_sys\_inp\_ctrl\_inpsys\_captA\_fsm\_state)—Offset 89048h

Input System Controller captureA sub-ctrl current and next state info Register (FSM and DMA cmd state)

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_inp\_ctrl\_inpsys\_captA\_fsm\_state:** [ISPMADR] + 89048h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:25	0h RW	<b>unused_isys_srst:</b> Unused
24	0h RW	<b>srst_csi_rcv_be_out:</b> Soft resets the output of the csi receiver backend
23	0h RW	<b>srst_cfifo_acq:</b> Soft resets the control and acknowledge FIFOs for the acquisition unit
22	0h RW	<b>srst_cfifo_cap_c:</b> Soft resets the control and acknowledge FIFOs for capture unit C
21	0h RW	<b>srst_cfifo_cap_b:</b> Soft resets the control and acknowledge FIFOs for capture unit B
20	0h RW	<b>srst_cfifo_cap_a:</b> Soft resets the control and acknowledge FIFOs for capture unit A
19	0h RW	<b>srst_dma:</b> Soft resets the DMA

Bit Range	Default & Access	Description
18	0h RW	<b>srst_wide_bus:</b> Soft resets the wide bus including the CIO converter
17	0h RW	<b>srst_gensh_fifo:</b> Soft resets the generic short FIFO
16	0h RW	<b>srst_cio2ahb:</b> Soft resets the CIO2AHB adapter
15	0h RW	<b>srst_str_mux:</b> Soft resets the streaming mux
14	0h RW	<b>srst_isys_top_ctrl:</b> Soft resets the input system Top controller
13	0h RW	<b>srst_isys_acq_ctrl:</b> Soft resets the input system Acquisition sub-controller (controls data-path from selected captA/captB/captC/dma_acq to acq)
12	0h RW	<b>srst_isys_captC_sub_ctrl:</b> Soft resets the input system CaptureC sub-controller (controls data-path from captC to dma_captC)
11	0h RW	<b>srst_isys_captB_sub_ctrl:</b> Soft resets the input system CaptureB sub-controller (controls data-path from captB to dma_captB)
10	0h RW	<b>srst_isys_captA_sub_ctrl:</b> Soft resets the input system CaptureA sub-controller (controls data-path from captA to dma_captA)
9	0h RW	<b>srst_acq:</b> Soft resets the acquisition unit
8	0h RW	<b>srst_capt_c:</b> Soft resets the capture unit C
7	0h RW	<b>srst_capt_b:</b> Soft resets the capture unit B
6	0h RW	<b>srst_capt_a:</b> Soft resets the capture unit A
5	0h RW	<b>srst_multi_cast_c:</b> Soft resets multi cast C
4	0h RW	<b>srst_multi_cast_b:</b> Soft resets multi cast B
3	0h RW	<b>srst_multi_cast_a:</b> Soft resets multi cast A
2	0h RW	<b>srst_capt_fifo_c:</b> Soft resets the FIFO before multi cast C
1	0h RW	<b>srst_capt_fifo_b:</b> Soft resets the FIFO before multi cast B
0	0h RW	<b>srst_capt_fifo_a:</b> Soft resets the FIFO before multi cast A

### 15.8.834 **reg\_inp\_sys\_gpreg\_isys\_slv\_reg\_srst\_type** (**inp\_sys\_gpreg\_isys\_slv\_reg\_srst**)—Offset 8A020h

Soft resets the slave accessible registers of certain input system modules. Writing a 1 to a field brings the registers for a module to their default value, writing a 0 allows them to be overwritten

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_gpreg\_isys\_slv\_reg\_srst:** [ISPMADR] + 8A020h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
			unused_isys_slv_reg_srst				srst_slv_reg_isys_ctrl	srst_slv_reg_dma	srst_slv_reg_acq	srst_slv_reg_capt_c	srst_slv_reg_capt_b	srst_slv_reg_capt_a

Bit Range	Default & Access	Description
31:6	0h RW	<b>unused_isys_slv_reg_srst:</b> Unused
5	0h RW	<b>srst_slv_reg_isys_ctrl:</b> Soft resets the slave accessible registers of the input system controller
4	0h RW	<b>srst_slv_reg_dma:</b> Soft resets the slave accessible registers of the DMA
3	0h RW	<b>srst_slv_reg_acq:</b> Soft resets the slave accessible registers of the acquisition unit
2	0h RW	<b>srst_slv_reg_capt_c:</b> Soft resets the slave accessible registers of capture unit C
1	0h RW	<b>srst_slv_reg_capt_b:</b> Soft resets the slave accessible registers of capture unit B
0	0h RW	<b>srst_slv_reg_capt_a:</b> Soft resets the slave accessible registers of capture unit A

### 15.8.835 reg\_inp\_sys\_gpreg\_str\_deint\_portA\_cnt\_type (inp\_sys\_gpreg\_str\_deint\_portA\_cnt)—Offset 8A024h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_gpreg\_str\_deint\_portA\_cnt:** [ISPMADR] + 8A024h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_str_deint_portA_cnt</b> : Unused
15:0	0h RW	<b>str_deint_portA_cnt</b> : stream data count for portA of stream deinterleave block

### 15.8.836 reg\_inp\_sys\_gpreg\_str\_deint\_portB\_cnt\_type (inp\_sys\_gpreg\_str\_deint\_portB\_cnt)—Offset 8A028h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_gpreg\_str\_deint\_portB\_cnt:** [ISPMADR] + 8A028h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0h RW	<b>unused_str_deint_portB_cnt</b> : Unused
15:0	0h RW	<b>str_deint_portB_cnt</b> : stream data count for portB of stream deinterleave block

### 15.8.837 reg\_inp\_sys\_fifo\_adapter\_CSI\_generic\_short\_packet\_available\_type

## (inp\_sys\_fifo\_adapter\_CSI\_generic\_short\_packet\_available)—Offset 8B008h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_fifo\_adapter\_CSI\_generic\_short\_packet\_available**  
: [ISPMMADR] + 8B008h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
unused_CSI_generic_short_packet_available								CSI_generic_short_packet_available

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_CSI_generic_short_packet_available:</b> Unused
0	1h RO	<b>CSI_generic_short_packet_available:</b> Returns 1 if there is a generic short packet available. Returns 0 is there is no generic short packet available.

## 15.8.838 reg\_inp\_sys\_irq\_ctrl\_irq\_edge\_type (inp\_sys\_irq\_ctrl\_irq\_edge)—Offset 8C000h

IRQ active edge select per interrupt input. Rising edge: 1, Falling edge: 0

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_irq\_ctrl\_irq\_edge:** [ISPMMADR] + 8C000h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_irq_edge:</b> Unused
18	0h RW	<b>strmon_irq:</b> Streaming monitor interrupt request
17	0h RO	<b>dma_irq:</b> DMA interrupt request
16	0h RW	<b>cio2ahb_irq:</b> CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	<b>inpsys_ctrl_irq:</b> Input system controller interrupt request
12	0h RW	<b>acq_irq:</b> Acquisition unit interrupt request
11:10	0h RW	<b>captC_irq:</b> Capture unit C interrupt request
9:8	0h RW	<b>captB_irq:</b> Capture unit B interrupt request
7:6	0h RW	<b>captA_irq:</b> Capture unit A interrupt request
5:4	0h RW	<b>csi_irq:</b> CSI receiver interrupt request
3	0h RW	<b>csi_pkt_eol:</b> End of Line of Frame packet from CSI receiver
2	0h RW	<b>csi_pkt_sol:</b> Start of Line packet from CSI receiver
1	0h RW	<b>csi_pkt_eof:</b> End of Frame packet from CSI receiver
0	0h RW	<b>csi_pkt_sof:</b> Start of Frame packet from CSI receiver

### 15.8.839 reg\_inp\_sys\_irq\_ctrl\_irq\_mask\_type (inp\_sys\_irq\_ctrl\_irq\_mask)—Offset 8C004h

IRQ mask per interrupt

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_irq\_ctrl\_irq\_mask:** [ISPMMADR] + 8C004h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
unused_irq_mask				strmon_irq	dma_irq	cio2ahb_irq	inpsys_ctrl_irq	acq_irq	captC_irq	captB_irq	captA_irq	csi_irq	csi_pkt_eol	csi_pkt_sol	csi_pkt_eof	csi_pkt_sof

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_irq_mask:</b> Unused
18	0h RW	<b>strmon_irq:</b> Streaming monitor interrupt request
17	0h RO	<b>dma_irq:</b> DMA interrupt request
16	0h RW	<b>cio2ahb_irq:</b> CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	<b>inpsys_ctrl_irq:</b> Input system controller interrupt request
12	0h RW	<b>acq_irq:</b> Acquisition unit interrupt request
11:10	0h RW	<b>captC_irq:</b> Capture unit C interrupt request
9:8	0h RW	<b>captB_irq:</b> Capture unit B interrupt request
7:6	0h RW	<b>captA_irq:</b> Capture unit A interrupt request
5:4	0h RW	<b>csi_irq:</b> CSI receiver interrupt request
3	0h RW	<b>csi_pkt_eol:</b> End of Line of Frame packet from CSI receiver
2	0h RW	<b>csi_pkt_sol:</b> Start of Line packet from CSI receiver
1	0h RW	<b>csi_pkt_eof:</b> End of Frame packet from CSI receiver
0	0h RW	<b>csi_pkt_sof:</b> Start of Frame packet from CSI receiver

### 15.8.840 reg\_inp\_sys\_irq\_ctrl\_irq\_status\_type (inp\_sys\_irq\_ctrl\_irq\_status)—Offset 8C008h

IRQ status for each unmasked interrupt

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_irq\_ctrl\_irq\_status:** [ISPMMADR] + 8C008h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
unused_irq_status				strmon_irq	dma_irq	cio2ahb_irq	inpsys_ctrl_irq	acq_irq	captC_irq	captB_irq	captA_irq	csi_irq	csi_pkt_eol	csi_pkt_sol	csi_pkt_eof	csi_pkt_sof

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_irq_status:</b> Unused
18	0h RO	<b>strmon_irq:</b> Streaming monitor interrupt request
17	0h RO	<b>dma_irq:</b> DMA interrupt request
16	0h RO	<b>cio2ahb_irq:</b> CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RO	<b>inpsys_ctrl_irq:</b> Input system controller interrupt request
12	0h RO	<b>acq_irq:</b> Acquisition unit interrupt request
11:10	0h RO	<b>captC_irq:</b> Capture unit C interrupt request
9:8	0h RO	<b>captB_irq:</b> Capture unit B interrupt request
7:6	0h RO	<b>captA_irq:</b> Capture unit A interrupt request
5:4	0h RO	<b>csi_irq:</b> CSI receiver interrupt request
3	0h RO	<b>csi_pkt_eol:</b> End of Line of Frame packet from CSI receiver
2	0h RO	<b>csi_pkt_sol:</b> Start of Line packet from CSI receiver
1	0h RO	<b>csi_pkt_eof:</b> End of Frame packet from CSI receiver
0	0h RO	<b>csi_pkt_sof:</b> Start of Frame packet from CSI receiver

### 15.8.841 reg\_inp\_sys\_irq\_ctrl\_irq\_clear\_type (inp\_sys\_irq\_ctrl\_irq\_clear)—Offset 8C00Ch

IRQ clear for interrupt set in irq\_status

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_irq\_ctrl\_irq\_clear:** [ISPMADR] + 8C00Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
unused_irq_clear			strmon_irq	dma_irq	cio2ahb_irq	inpsys_ctrl_irq	acq_irq	captC_irq	captB_irq	captA_irq	csi_irq	csi_pkt_eol	csi_pkt_sol	csi_pkt_eof	csi_pkt_sof

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_irq_clear:</b> Unused
18	0h WO	<b>strmon_irq:</b> Streaming monitor interrupt request
17	0h RO	<b>dma_irq:</b> DMA interrupt request
16	0h WO	<b>cio2ahb_irq:</b> CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h WO	<b>inpsys_ctrl_irq:</b> Input system controller interrupt request
12	0h WO	<b>acq_irq:</b> Acquisition unit interrupt request
11:10	0h WO	<b>captC_irq:</b> Capture unit C interrupt request
9:8	0h WO	<b>captB_irq:</b> Capture unit B interrupt request
7:6	0h WO	<b>captA_irq:</b> Capture unit A interrupt request
5:4	0h WO	<b>csi_irq:</b> CSI receiver interrupt request
3	0h WO	<b>csi_pkt_eol:</b> End of Line of Frame packet from CSI receiver
2	0h WO	<b>csi_pkt_sol:</b> Start of Line packet from CSI receiver
1	0h WO	<b>csi_pkt_eof:</b> End of Frame packet from CSI receiver
0	0h WO	<b>csi_pkt_sof:</b> Start of Frame packet from CSI receiver

## 15.8.842 reg\_inp\_sys\_irq\_ctrl\_irq\_en\_type (inp\_sys\_irq\_ctrl\_irq\_en)– Offset 8C010h

IRQ enable per interrupt bit

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_irq\_ctrl\_irq\_en:** [ISPMADDR] + 8C010h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

7:6	0h RW	<b>captA_irq:</b> Capture unit A interrupt request
5:4	0h RW	<b>csi_irq:</b> CSI receiver interrupt request
3	0h RW	<b>csi_pkt_eol:</b> End of Line of Frame packet from CSI receiver
2	0h RW	<b>csi_pkt_sol:</b> Start of Line packet from CSI receiver
1	0h RW	<b>csi_pkt_eof:</b> End of Frame packet from CSI receiver
0	0h RW	<b>csi_pkt_sof:</b> Start of Frame packet from CSI receiver

### 15.8.843 reg\_inpsys\_irq\_ctrl\_irq\_level\_not\_pulse\_type (inpsys\_irq\_ctrl\_irq\_level\_not\_pulse)—Offset 8C014h

IRQ setting per interrupt bit for level or pulse irq generation at output pin. Level: 1, Pulse: 0

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inpsys\_irq\_ctrl\_irq\_level\_not\_pulse:** [ISPMADDR] + 8C014h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
unused_irq_level_not_pulse				strmon_irq	dma_irq	cio2ahb_irq	inpsys_ctrl_irq	acq_irq	captC_irq	captB_irq	captA_irq	csi_irq	csi_pkt_eol	csi_pkt_sol	csi_pkt_eof	csi_pkt_sof

Bit Range	Default & Access	Description
31:19	0h RW	<b>unused_irq_level_not_pulse:</b> Unused
18	0h RW	<b>strmon_irq:</b> Streaming monitor interrupt request
17	0h RO	<b>dma_irq:</b> DMA interrupt request
16	0h RW	<b>cio2ahb_irq:</b> CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	<b>inpsys_ctrl_irq:</b> Input system controller interrupt request
12	0h RW	<b>acq_irq:</b> Acquisition unit interrupt request
11:10	0h RW	<b>captC_irq:</b> Capture unit C interrupt request
9:8	0h RW	<b>captB_irq:</b> Capture unit B interrupt request
7:6	0h RW	<b>captA_irq:</b> Capture unit A interrupt request
5:4	0h RW	<b>csi_irq:</b> CSI receiver interrupt request
3	0h RW	<b>csi_pkt_eol:</b> End of Line of Frame packet from CSI receiver

Bit Range	Default & Access	Description
2	0h RW	<b>csi_pkt_sol</b> : Start of Line packet from CSI receiver
1	0h RW	<b>csi_pkt_eof</b> : End of Frame packet from CSI receiver
0	0h RW	<b>csi_pkt_sof</b> : Start of Frame packet from CSI receiver

### 15.8.844 **reg\_isel\_gpr\_reg\_gp\_syncgen\_enable\_type** (**isel\_gpr\_reg\_gp\_syncgen\_enable**)—Offset 90000h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syncgen\_enable:** [ISPMMADR] + 90000h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_syncgen_enable								reg_gp_syncgen_enable

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_syncgen_enable:</b> Unused
0	0h RW	<b>reg_gp_syncgen_enable:</b> Enables (value=1) or disables (value=0) the Sync Generator.

### 15.8.845 **reg\_isel\_gpr\_reg\_gp\_syncgen\_free\_running\_type** (**isel\_gpr\_reg\_gp\_syncgen\_free\_running**)—Offset 90004h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syncgen\_free\_running:** [ISPMMADR] + 90004h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_syncgen_free_running:</b> Unused
0	0h RW	<b>reg_gp_syncgen_free_running:</b> Sets the sync generator in free running mode (value=1) or let it stall in sync with either the PRBS or TPG (value=0)

### 15.8.846 reg\_isel\_gpr\_reg\_gp\_syncgen\_pause\_type (isel\_gpr\_reg\_gp\_syncgen\_pause)—Offset 90008h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syncgen\_pause:** [ISPMADR] + 90008h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_syncgen_pause:</b> Unused

Bit Range	Default & Access	Description
0	0h RW	<b>reg_gp_syncgen_pause:</b> Sets the sync generator in pause mode (value=1) or not (value=0)

### 15.8.847 **reg\_isel\_gpr\_reg\_gp\_nr\_frames\_type** (**isel\_gpr\_reg\_gp\_nr\_frames**)—Offset 9000Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_nr\_frames:** [ISPMADDR] + 9000Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_reg_gp_nr_frames												reg_gp_nr_frames																							

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_nr_frames:</b> Unused
13:0	0h RW	<b>reg_gp_nr_frames:</b> Sets the sync generator parameter Number of Frames

### 15.8.848 **reg\_isel\_gpr\_reg\_gp\_syngen\_nr\_pix\_type** (**isel\_gpr\_reg\_gp\_syngen\_nr\_pix**)—Offset 90010h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syngen\_nr\_pix:** [ISPMADDR] + 90010h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syngen_nr_pix:</b> Unused
13:0	0h RW	<b>reg_gp_syngen_nr_pix:</b> Sets the number of active pixels per line in the Sync Generator

### 15.8.849 reg\_isel\_gpr\_reg\_gp\_syngen\_nr\_lines\_type (isel\_gpr\_reg\_gp\_syngen\_nr\_lines)—Offset 90014h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syngen\_nr\_lines:** [ISPMADDR] + 90014h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syngen_nr_lines:</b> Unused
13:0	0h RW	<b>reg_gp_syngen_nr_lines:</b> Sets the number of lines per frame in the Sync generator

### 15.8.850 reg\_isel\_gpr\_reg\_gp\_syngen\_hblank\_cycles\_type (isel\_gpr\_reg\_gp\_syngen\_hblank\_cycles)—Offset 90018h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syngen\_hblank\_cycles:** [ISPMADDR] + 90018h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syngen_hblank_cycles:</b> Unused
13:0	0h RW	<b>reg_gp_syngen_hblank_cycles:</b> Sets the number of cycles between the end-of-line and start-of-line pulses.

### 15.8.851 reg\_isel\_gpr\_reg\_gp\_syngen\_vblank\_cycles\_type (isel\_gpr\_reg\_gp\_syngen\_vblank\_cycles)—Offset 9001Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syngen\_vblank\_cycles:** [ISPMADDR] + 9001Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syngen_vblank_cycles:</b> Unused
13:0	0h RW	<b>reg_gp_syngen_vblank_cycles:</b> Sets the number of cycles between the end-of-frame and start-of-frame pulses.

### 15.8.852 reg\_isel\_gpr\_reg\_gp\_isel\_sof\_type (isel\_gpr\_reg\_gp\_isel\_sof) – Offset 90020h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_sof:** [ISPMADDR] + 90020h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_isel_sof:</b> Unused
0	0h RW	<b>reg_gp_isel_sof:</b> Sets the input selector gp_sof input.

### 15.8.853 reg\_isel\_gpr\_reg\_gp\_isel\_eof\_type (isel\_gpr\_reg\_gp\_isel\_eof)—Offset 90024h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_eof:** [ISPMADR] + 90024h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_isel_eof:</b> Unused
0	0h RW	<b>reg_gp_isel_eof:</b> Sets the input selector gp_eof input.

### 15.8.854 reg\_isel\_gpr\_reg\_gp\_isel\_sol\_type (isel\_gpr\_reg\_gp\_isel\_sol)—Offset 90028h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_sol:** [ISPMADR] + 90028h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_isel_sol</b> : Unused
0	0h RW	<b>reg_gp_isel_sol</b> : Sets the input selector gp_sol input.

### 15.8.855 reg\_isel\_gpr\_reg\_gp\_isel\_eol\_type (isel\_gpr\_reg\_gp\_isel\_eol)—Offset 9002Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_eol:** [ISPMADDR] + 9002Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_eol								reg_gp_isel_eol

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_isel_eol</b> : Unused
0	0h RW	<b>reg_gp_isel_eol</b> : Sets the input selector gp_eol input.

### 15.8.856 reg\_isel\_gpr\_reg\_gp\_isel\_lfsr\_enable\_type (isel\_gpr\_reg\_gp\_isel\_lfsr\_enable)—Offset 90030h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_lfsr\_enable:** [ISPMADDR] + 90030h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_isel_lfsr_enable:</b> Unused
0	0h RW	<b>reg_gp_isel_lfsr_enable:</b> Enables the PRBS

### 15.8.857 reg\_isel\_gpr\_reg\_gp\_isel\_lfsr\_enable\_b\_type (isel\_gpr\_reg\_gp\_isel\_lfsr\_enable\_b) – Offset 90034h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_lfsr\_enable\_b:** [ISPMADDR] + 90034h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_reg_gp_isel_lfsr_enable_b:</b> Unused

Bit Range	Default & Access	Description
0	0h RW	<b>reg_gp_isel_lfsr_enable_b:</b> Enables the PRBS for port b

### 15.8.858 **reg\_isel\_gpr\_reg\_gp\_isel\_lfsr\_reset\_value\_type** (**isel\_gpr\_reg\_gp\_isel\_lfsr\_reset\_value**)—Offset 90038h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_lfsr\_reset\_value:** [ISPMMADR] + 90038h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31	0h RW	<b>unused_reg_gp_isel_lfsr_reset_value:</b> Unused
30:0	0h RW	<b>reg_gp_isel_lfsr_reset_value:</b> Set the reset value of the LFSR in the PRBS of the Input selector

### 15.8.859 **reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_enable\_type** (**isel\_gpr\_reg\_gp\_isel\_tpg\_enable**)—Offset 9003Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_enable:** [ISPMMADR] + 9003Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_isel_tpg_enable: Unused
0	0h RW	reg_gp_isel_tpg_enable: Enables the test pattern generator

### 15.8.860 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_enable\_b\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_enable\_b)—Offset 90040h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_enable\_b:** [ISPMADR] + 90040h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_isel_tpg_enable_b: Unused

Bit Range	Default & Access	Description
0	0h RW	<b>reg_gp_isel_tpg_enable_b:</b> Enables the test pattern generator for port b

### 15.8.861 reg\_isel\_gpr\_reg\_gp\_isel\_hor\_cnt\_mask\_type (isel\_gpr\_reg\_gp\_isel\_hor\_cnt\_mask)—Offset 90044h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_hor\_cnt\_mask:** [ISPMMADR] + 90044h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_isel_hor_cnt_mask:</b> Unused
13:0	0h RW	<b>reg_gp_isel_hor_cnt_mask:</b> Sets the horizontal counter mask in the Input selector

### 15.8.862 reg\_isel\_gpr\_reg\_gp\_isel\_ver\_cnt\_mask\_type (isel\_gpr\_reg\_gp\_isel\_ver\_cnt\_mask)—Offset 90048h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_ver\_cnt\_mask:** [ISPMMADR] + 90048h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_isel_ver_cnt_mask:</b> Unused
13:0	0h RW	<b>reg_gp_isel_ver_cnt_mask:</b> Sets the vertical counter mask in the Input selector

### 15.8.863 reg\_isel\_gpr\_reg\_gp\_isel\_xy\_cnt\_mask\_type (isel\_gpr\_reg\_gp\_isel\_xy\_cnt\_mask)—Offset 9004Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_xy\_cnt\_mask:** [ISPMADDR] + 9004Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_xy_cnt_mask:</b> Unused

Bit Range	Default & Access	Description
11:0	0h RW	<b>reg_gp_isel_xy_cnt_mask:</b> Sets the xy counter mask in the Input selector

### 15.8.864 **reg\_isel\_gpr\_reg\_gp\_isel\_hor\_cnt\_delta\_type** (isel\_gpr\_reg\_gp\_isel\_hor\_cnt\_delta)—Offset 90050h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_hor\_cnt\_delta:** [ISPMADR] + 90050h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_hor_cnt_delta								reg_gp_isel_hor_cnt_delta

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_gp_isel_hor_cnt_delta:</b> Unused
3:0	0h RW	<b>reg_gp_isel_hor_cnt_delta:</b> sets the horizontal counter delta in the Input selector

### 15.8.865 **reg\_isel\_gpr\_reg\_gp\_isel\_ver\_cnt\_delta\_type** (isel\_gpr\_reg\_gp\_isel\_ver\_cnt\_delta)—Offset 90054h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_ver\_cnt\_delta:** [ISPMADR] + 90054h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	unused_reg_gp_isel_ver_cnt_delta: Unused
3:0	0h RW	reg_gp_isel_ver_cnt_delta: Sets the vertical counter delta in the Input selector

### 15.8.866 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_mode\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_mode)—Offset 90058h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_mode:** [ISPMADDR] + 90058h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	unused_reg_gp_isel_tpg_mode: Unused
1:0	0h RW	reg_gp_isel_tpg_mode: Sets the mode of the test pattern generator. 'b00-ramp mode, 'b01-checkerboard, 'b10-frame based color

### 15.8.867 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_red1\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_red1)—Offset 9005Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_red1:** [ISPMADR] + 9005Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_tpg_red1:</b> Unused
11:0	0h RW	<b>reg_gp_isel_tpg_red1:</b> Defines the red1 color for test pattern generator

### 15.8.868 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_green1\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_green1)—Offset 90060h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_green1:** [ISPMADR] + 90060h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_tpg_green1:</b> Unused
11:0	0h RW	<b>reg_gp_isel_tpg_green1:</b> Defines the green1 color for test pattern generator

### 15.8.869 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_blue1\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_blue1)—Offset 90064h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_blue1:** [ISPMADR] + 90064h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_tpg_blue1:</b> Unused
11:0	0h RW	<b>reg_gp_isel_tpg_blue1:</b> Defines the blue1 color for test pattern generator

### 15.8.870 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_red2\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_red2)—Offset 90068h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_red2:** [ISPMADR] + 90068h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_tpg_red2					reg_gp_isel_tpg_red2			

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_tpg_red2:</b> Unused
11:0	0h RW	<b>reg_gp_isel_tpg_red2:</b> Defines the red2 color for test pattern generator

### 15.8.871 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_green2\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_green2)—Offset 9006Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_green2:** [ISPMADR] + 9006Ch

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_tpg_green2:</b> Unused
11:0	0h RW	<b>reg_gp_isel_tpg_green2:</b> Defines the green2 color for test pattern generator

### 15.8.872 reg\_isel\_gpr\_reg\_gp\_isel\_tpg\_blue2\_type (isel\_gpr\_reg\_gp\_isel\_tpg\_blue2)—Offset 90070h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_tpg\_blue2:** [ISPMMADR] + 90070h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	<b>unused_reg_gp_isel_tpg_blue2:</b> Unused
11:0	0h RW	<b>reg_gp_isel_tpg_blue2:</b> Defines the blue2 color for test pattern generator

### 15.8.873 reg\_isel\_gpr\_reg\_gp\_isel\_ch\_id\_type (isel\_gpr\_reg\_gp\_isel\_ch\_id)—Offset 90074h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_ch\_id:** [ISPMADDR] + 90074h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_reg_gp_isel_ch_id:</b> Unused
1:0	0h RW	<b>reg_gp_isel_ch_id:</b> Sets the channel id input for the Input selector

### 15.8.874 reg\_isel\_gpr\_reg\_gp\_isel\_fmt\_type\_type (isel\_gpr\_reg\_gp\_isel\_fmt\_type)—Offset 90078h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_fmt\_type:** [ISPMADDR] + 90078h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:5	0h RW	<b>unused_reg_gp_isel_fmt_type:</b> Unused
4:0	0h RW	<b>reg_gp_isel_fmt_type:</b> Sets the format type input for the Input selector

### 15.8.875 reg\_isel\_gpr\_reg\_gp\_isel\_data\_sel\_type (isel\_gpr\_reg\_gp\_isel\_data\_sel)—Offset 9007Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_data\_sel:** [ISPMADDR] + 9007Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
<div style="display: flex; justify-content: space-between;"> <div style="writing-mode: vertical-rl; transform: rotate(180deg);">unused_reg_gp_isel_data_sel</div> <div style="writing-mode: vertical-rl; transform: rotate(180deg);">reg_gp_isel_data_sel</div> </div>																																			

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_reg_gp_isel_data_sel:</b> Unused
1:0	0h RW	<b>reg_gp_isel_data_sel:</b> Select value for the data multiplexer in the Input selector

### 15.8.876 reg\_isel\_gpr\_reg\_gp\_isel\_sband\_sel\_type (isel\_gpr\_reg\_gp\_isel\_sband\_sel)—Offset 90080h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_sband\_sel:** [ISPMADDR] + 90080h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_reg_gp_isel_sband_sel:</b> Unused
1:0	0h RW	<b>reg_gp_isel_sband_sel:</b> Select value for the side band multiplexer in the Input selector

### 15.8.877 reg\_isel\_gpr\_reg\_gp\_isel\_sync\_sel\_type (isel\_gpr\_reg\_gp\_isel\_sync\_sel)—Offset 90084h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_isel\_sync\_sel:** [ISPMADR] + 90084h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	<b>unused_reg_gp_isel_sync_sel:</b> Unused
1:0	0h RW	<b>reg_gp_isel_sync_sel:</b> Select value for the sync multiplexer in the Input selector

### 15.8.878 **reg\_isel\_gpr\_reg\_gp\_syncgen\_hor\_cnt\_type** (isel\_gpr\_reg\_gp\_syncgen\_hor\_cnt)—Offset 90088h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syncgen\_hor\_cnt:** [ISPMADDR] + 90088h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syncgen_hor_cnt:</b> Unused
13:0	0h RO	<b>reg_gp_syncgen_hor_cnt:</b> Returns the value of the horizontal counter in the sync generator

### 15.8.879 **reg\_isel\_gpr\_reg\_gp\_syncgen\_ver\_cnt\_type** (isel\_gpr\_reg\_gp\_syncgen\_ver\_cnt)—Offset 9008Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syncgen\_ver\_cnt:** [ISPMADDR] + 9008Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syncgen_ver_cnt:</b> Unused
13:0	0h RO	<b>reg_gp_syncgen_ver_cnt:</b> Returns the value of the vertical counter in the sync generator

### 15.8.880 reg\_isel\_gpr\_reg\_gp\_syncgen\_frame\_cnt\_type (isel\_gpr\_reg\_gp\_syncgen\_frame\_cnt)—Offset 90090h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_gpr\_reg\_gp\_syncgen\_frame\_cnt:** [ISPMMADR] + 90090h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	<b>unused_reg_gp_syncgen_frame_cnt:</b> Unused

Bit Range	Default & Access	Description
13:0	0h RO	<b>reg_gp_syncgen_frame_cnt</b> : Returns the value of the frame counter in the sync generator

### 15.8.881 **reg\_isel\_gpr\_reg\_gp\_soft\_reset\_type (isel\_gpr\_reg\_gp\_soft\_reset)—Offset 90094h**

Soft resets the modules in the input selector cluster

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_gpr\_reg\_gp\_soft\_reset:** [ISPMADDR] + 90094h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_gp_soft_reset</b> : Unused
3	0h RW	<b>srst_fifo</b> : If 1, the fifo is held in reset mode. If 0, the fifo is not in reset state.
2	0h RW	<b>srst_tpg</b> : If 1, the TPG is held in reset mode. If 0, the TPG is not in reset state.
1	0h RW	<b>srst_prbs</b> : If 1, the PRBS is held in reset mode. If 0, the PRBS is not in reset state.
0	0h RW	<b>srst_syncgen</b> : If 1, the sync generator is held in reset mode. If 0, the sync generator is not in reset state.

### 15.8.882 **reg\_isel\_fa\_send\_to\_GP\_FIFO\_type (isel\_fa\_send\_to\_GP\_FIFO)—Offset 90100h**

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**isel\_fa\_send\_to\_GP\_FIFO:** [ISPMADDR] + 90100h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:26	0h RW	<b>unused_send_to_GP_FIFO:</b> Unused
25:0	0h WO	<b>send_to_GP_FIFO:</b> Send data to input selector GP FIFO

### 15.8.883 **reg\_isel\_fa\_check\_send\_to\_GP\_FIFO\_type** (isel\_fa\_check\_send\_to\_GP\_FIFO)—Offset 90108h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_fa\_check\_send\_to\_GP\_FIFO:** [ISPMMADR] + 90108h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000001h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_check_send_to_GP_FIFO:</b> Unused
0	1h WO	<b>check_send_to_GP_FIFO:</b> Check for availability of GP FIFO. Returns 1 if a word can be send to the input selector, without it being stalled

### 15.8.884 reg\_isel\_irq\_ctrl\_reg\_irq\_edge\_type (isel\_irq\_ctrl\_reg\_irq\_edge)—Offset 90200h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_irq\_ctrl\_reg\_irq\_edge:** [ISPMMADR] + 90200h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_irq_edge:</b> Unused
3:0	0h RW	<b>reg_irq_edge:</b> indicates for each bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

### 15.8.885 reg\_isel\_irq\_ctrl\_reg\_irq\_mask\_type (isel\_irq\_ctrl\_reg\_irq\_mask)—Offset 90204h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_irq\_ctrl\_reg\_irq\_mask:** [ISPMMADR] + 90204h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_irq_mask:</b> Unused
3:0	0h RW	<b>reg_irq_mask:</b> indicates for each bit of irq_di whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

### 15.8.886 reg\_isel\_irq\_ctrl\_reg\_irq\_status\_type (isel\_irq\_ctrl\_reg\_irq\_status)—Offset 90208h

Indicates for each bit whether a non-masked interrupt has been generated (value='1'). Can be cleared by writing a '1' into the the corresponding bit of the req\_irq\_clear register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_irq\_ctrl\_reg\_irq\_status:** [ISPMMADR] + 90208h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_irq_status:</b> Unused
3	0h RO	<b>irq_stat_syncgen_eol:</b> Represents the irq status of the eol (end of line) bit generated by the sync generator
2	0h RO	<b>irq_stat_syncgen_sol:</b> Represents the irq status of the sol (start of line) bit generated by the sync generator
1	0h RO	<b>irq_stat_syncgen_eof:</b> Represents the irq status of the eof (end of frame) bit generated by the sync generator
0	0h RO	<b>irq_stat_syncgen_sof:</b> Represents the irq status of the sof (start of frame) bit generated by the sync generator

### 15.8.887 reg\_isel\_irq\_ctrl\_reg\_irq\_clear\_type (isel\_irq\_ctrl\_reg\_irq\_clear)—Offset 9020Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_irq\_ctrl\_reg\_irq\_clear:** [ISPMADDR] + 9020Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
unused_reg_irq_clear								reg_irq_clear			

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_irq_clear:</b> Unused
3:0	0h WO	<b>reg_irq_clear:</b> Clears (set to '0') bits in reg_irq_status. When writing a '1' into a bit of this register, the corresponding bit in the req_irq_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the req_irq_status is not affected.

## 15.8.888 reg\_isel\_irq\_ctrl\_reg\_irq\_enable\_type (isel\_irq\_ctrl\_reg\_irq\_enable)—Offset 90210h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_irq\_ctrl\_reg\_irq\_enable:** [ISPMADDR] + 90210h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
unused_reg_irq_enable								reg_irq_enable			

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_irq_enable:</b> Unused
3:0	0h RW	<b>reg_irq_enable:</b> Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also affects the IRQ pin (value='1') or not (value='0')

### 15.8.889 reg\_isel\_irq\_ctrl\_reg\_irq\_level\_not\_pulse\_type (isel\_irq\_ctrl\_reg\_irq\_level\_not\_pulse)—Offset 90214h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**isel\_irq\_ctrl\_reg\_irq\_level\_not\_pulse:** [ISPMMADR] + 90214h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_irq_level_not_pulse								reg_irq_level_not_pulse

Bit Range	Default & Access	Description
31:4	0h RW	<b>unused_reg_irq_level_not_pulse:</b> Unused
3:0	0h RW	<b>reg_irq_level_not_pulse:</b> Indicates for each bit whether an interrupt cause is translated into a pulse (value='0') or into a constant level '1' (value='1') on the IRQ pin

### 15.8.890 reg\_icache\_out\_sys\_c\_mmu\_MMU\_invalidate\_cache\_type (icache\_out\_sys\_c\_mmu\_MMU\_invalidate\_cache)—Offset A0000h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**icache\_out\_sys\_c\_mmu\_MMU\_invalidate\_cache:** [ISPMMADR] + A0000h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_MMU_invalidate_cache:</b> Unused
0	0h WO	<b>MMU_invalidate_cache:</b> MMU invalidate cache. When '1', the MMUs TLB is invalidated.

### 15.8.891 reg\_icache\_out\_sys\_c\_mmu\_MMU\_page\_table\_base\_type (icache\_out\_sys\_c\_mmu\_MMU\_page\_table\_base)—Offset A0004h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**icache\_out\_sys\_c\_mmu\_MMU\_page\_table\_base:**  
[ISPMMADR] + A0004h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	0h RW	<b>unused_MMU_page_table_base:</b> Unused

Bit Range	Default & Access	Description
23:0	0h RW	<b>MMU_page_table_base:</b> Defines the physical page number of the page tables

### 15.8.892 mem\_scp\_config\_ilm\_conf\_ilm\_prg\_mem\_sl\_ip\_pmem\_prg\_mem\_first\_type (scp\_config\_ilm\_conf\_ilm\_prg\_mem\_sl\_ip\_pmem\_prg\_mem\_first) –Offset B0000h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**scp\_config\_ilm\_conf\_ilm\_prg\_mem\_sl\_ip\_pmem\_prg\_mem\_first:** [ISPMMAADR] + B0000h

**ISPMMAADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMAADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000000000000000h

Bit Range	Default & Access	Description
63:0	0h RW	<b>prg_mem_first:</b> Read Latency of 1 cycles. Write latency of 0 cycles

### 15.8.893 mem\_scp\_config\_ilm\_conf\_ilm\_prg\_mem\_sl\_ip\_pmem\_prg\_mem\_last\_type (scp\_config\_ilm\_conf\_ilm\_prg\_mem\_sl\_ip\_pmem\_prg\_mem\_last) –Offset B7FF8h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**scp\_config\_ilm\_conf\_ilm\_prg\_mem\_sl\_ip\_pmem\_prg\_mem\_last:** [ISPMMAADR] + B7FF8h

**ISPMMAADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMAADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000000000000000h

Bit Range	Default & Access	Description
63:0	0h RW	<b>prg_mem_last:</b> Read Latency of 1 cycles. Write latency of 0 cycles

### 15.8.894 mem\_isp\_simd\_vamem1\_asp\_lut\_sl\_ipvamem\_asp\_lut\_first\_type (isp\_simd\_vamem1\_asp\_lut\_sl\_ipvamem\_asp\_lut\_first)– Offset 1C0000h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**isp\_simd\_vamem1\_asp\_lut\_sl\_ipvamem\_asp\_lut\_first:** [ISPMMADR] + 1C0000h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 0000h

15	12	8	4	0

**Default:** 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
unused_check_receive_from_SP								check_receive_from_SP

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_check_receive_from_SP:</b> Unused
0	1h RO	<b>check_receive_from_SP:</b> Check for potential stalling for receiving data on SP streaming output port. Returns 1 if a receive from SP would lead to a stall. Returns 0 if a token is available from the SP.

### 15.8.909 reg\_fa\_sp\_isp\_check\_receive\_from\_ISP\_type (fa\_sp\_isp\_check\_receive\_from\_ISP)—Offset 380014h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**fa\_sp\_isp\_check\_receive\_from\_ISP:** [ISPMMADR] + 380014h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000001h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_check_receive_from_ISP:</b> Unused
0	1h RO	<b>check_receive_from_ISP:</b> Check for potential stalling for receiving data on ISP streaming output port. Returns 1 if a receive from ISP would lead to a stall. Returns 0 if a token is available from the ISP.

### 15.8.910 reg\_fa\_sp\_isp\_check\_send\_to\_SP\_type (fa\_sp\_isp\_check\_send\_to\_SP)—Offset 380018h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**fa\_sp\_isp\_check\_send\_to\_SP:** [ISPMADDR] + 380018h

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_check_send_to_SP:</b> Unused
0	0h RO	<b>check_send_to_SP:</b> Check for potential stalling for sending data to SP streaming input port. Returns 1 if a send to SP would lead to a stall. Returns 0 when there is space left in the SP token FIFO

### 15.8.911 reg\_fa\_sp\_isp\_check\_send\_to\_ISP\_type (fa\_sp\_isp\_check\_send\_to\_ISP)—Offset 38001Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**fa\_sp\_isp\_check\_send\_to\_ISP:** [ISPMMADR] + 38001Ch

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	<b>unused_check_send_to_ISP:</b> Unused
0	0h RO	<b>check_send_to_ISP:</b> Check for potential stalling for sending data to ISP streaming input port. Returns 1 if a send to ISP would lead to a stall. Returns 0 when there is space left in the ISP token FIFO

## 16 Storage Control Cluster (eMMC, SDIO, SD Card)

The Storage Control Cluster (SCC) consists of SDIO, SD Card and eMMC controllers to support mass storage and IO devices.

- One eMMC 4.5 interface
- One SD Card 3.0 interface
- One SDIO 3.0 interface for SDIO-based WIFI

**Note:** All units in the SCC support both PCI mode and ACPI mode of operation. A level shifter may be needed on the platform for SDIO 3.0 compliance. An eMMC 4.41 controller also exists but shouldn't be used.

**Note:** eMMC\* 5.0 is functional and backward compatible on the Bay Trail platform for features included in eMMC 4.5, with no guarantees the performance is as good as eMMC\* 4.5.

### 16.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 181. eMMC Signals

Signal Name	Direction Power	Description
<b>MMC1_CLK</b>	O V1P8S	<b>eMMC Clock</b> The frequency may vary between 400 kHz and 200 MHz.
<b>MMC1_D[7:0]</b>	I/O V1P8S	<b>eMMC Port Data bits 0 to 7</b> Bidirectional port used to transfer data to and from eMMC device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using either D[0]-D[3] or D[0]-D[7], by the MultiMedia Card controller. The MultiMedia Card includes internal pull-ups for data lines D[1]-D[7]. Immediately after entering the 4-bit mode, the card disconnects the internal pull ups of lines D[1], D[2], and D[3]. Correspondingly, immediately after entering to the 8-bit mode the card disconnects the internal pull-ups of lines D[1]-D[7].
<b>MMC1_CMD</b>	I/O V1P8S	<b>eMMC Port Command</b> This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
<b>MMC1_RCOMP</b>	-	<b>eMMC RCOMP</b> This signal is used for pre-driver slew rate compensation.
<b>MMC1_RST#</b>	O V1P8S	<b>eMMC Reset Signals</b> Active low to reset.

Table 182. SDIO Signals

Signal Name	Direction Power	Description
<b>SD2_CLK</b>	O V1P8S	<b>SDIO Clock</b> The frequency may vary between 24 and 50MHz.
<b>SD2_D[2:0]</b>	I/O V1P8S	<b>SDIO Port Data bits 0 to 2</b> Bidirectional port used to transfer data to and from SDIO device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
<b>SD2_D[3]_CD#</b>	I/O V1P8S	<b>SDIO Port Data bit 3</b> Bidirectional port used to transfer data to and from the SDIO device. Also, <b>Card Detect</b> . Active low when device is present.
<b>SD2_CMD</b>	I/O V1P8S	<b>SDIO Port Command</b> This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.

Table 183. SD Card Signals

Signal Name	Direction Power	Description
<b>SD3_CLK</b>	O VSDIO	<b>SD Card Clock</b> The frequency may vary between 24 and 50 MHz.
<b>SD3_D[3:0]</b>	I/O VSDIO	<b>SD Card Data bits 0 to 3</b> Bidirectional port used to transfer data to and from SD card. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
<b>SD3_CD#</b>	I/O V1P8S	<b>SD Card Detect</b> Active low when a card is present. Floating (pulled high with internal PU) when a card is not present.
<b>SD3_CMD</b>	I/O VSDIO	<b>SD Card Command</b> This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
<b>SD3_1P8EN</b>	O V1P8S	<b>SD Card 1.8V Enable</b> Indicates the voltage of the SD Card to the power delivery subsystem. The default voltage (3.3 V) is requested when this signal is driven low. 1.8 V is requested when this signal is high. This voltage change applies to the SD3_V1P8V3P3_S3 (VSDIO) rail on the SoC.
<b>SD3_RCOMP</b>	-	<b>SD Card RCOMP</b> This signal is used for pre-driver slew rate compensation.
<b>SD3_WP</b>	I V1P8S	<b>SD Card Write Protect</b> Active high to protect from write.
<b>SD3_PWREN#</b>	O V1P8S	<b>SD Card Power Enable</b> This signal is used to enable power on a SD device.

## 16.2 Features

### 16.2.1 eMMC Interface Features

- eMMC 4.5 controller supported
- Transfers the data in 1 bit, 4 bit and 8 bit modes.
- Transfers data in the following speed classes: Baseline (1, 4, 8 bit up to 25Mhz), HS SDR/DDR (4, 8 bit up to 50Mhz) and HS200 (4, 8 bit up to 200MHz - 4.5 controller only)
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Supports MMC Plus and MMC mobile.
- Supports both round-robin and priority-based arbitration for transmit operation.
- Run-time configurability of channel ID bits.

## 16.2.2 SDIO/SD Card Interface Features

- Up to 400Mbps per second data rate using 4 parallel data lines.
- Transfers the data in 1 bit and 4 bit SD modes and SPI mode.
- Transfers the data in following UHS-I modes: HS ,DDR50 and SDR12/25.
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Designed to work with I/O cards, Read-only cards and Read/Write cards.
- Supports Read wait Control, Suspend/Resume operation.

**Note:** SDIO only validated with WIFI devices.

## 16.2.3 Storage Interfaces Overview

This section provides a very high level overview of the SD, SDIO, eMMC 4.5 specification. Refer to the SD and eMMC specifications for complete details.

### 16.2.3.1 SD Card 3.0 Bus Interface

The SD Card bus has a single master, single slaves (card), synchronous topology (refer to [Figure 98](#)). During initialization process commands are sent to the card, allowing the application to detect the card and assign logical addresses to the physical slot. All data communication in the Card Identification Mode uses the command line (CMD) only.

SD bus allows dynamic configuration of the number of data lines. After power up, by default, the SD Card will use only SD3\_D[0] for data transfer. After initialization the host can change the bus width (number of active data lines). This feature allows easy trade off between hardware cost and system performance. Note that while DAT1-SD3\_D[3:1] are not in use, the SoC will tri-state those signals.

**Figure 98. SD Memory Card Bus Topology**

### 16.2.3.2 SDIO 3.0 Interface

The SDIO interface is the very much like the SD card interface. The SoC supports one SDIO device for wireless devices only (no memory card support).

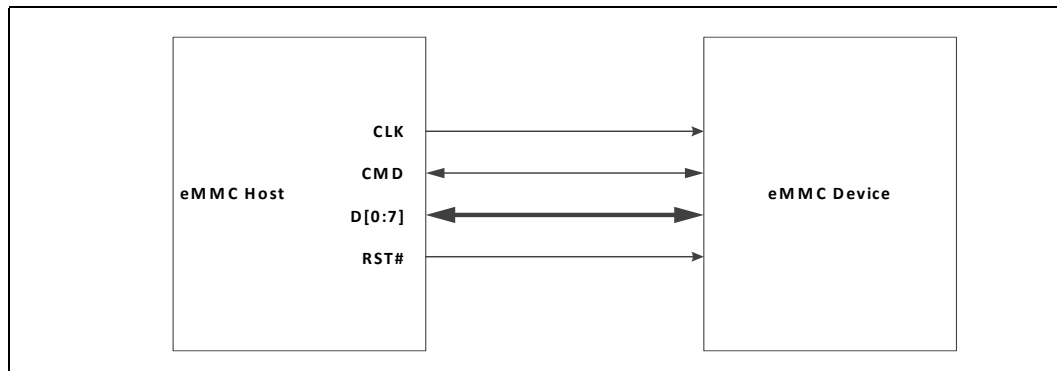

**Note:** SDIO interface does not support WAKE function.

**Figure 99. SDIO Device Bus Topology**

### 16.2.3.3 eMMC4.5 Interface

**Figure 100. eMMC Interface**

## 16.3 References

The controller is configured to comply with:

- SD Specification Part 01 Physical Layer Specification version 3.00, April 16, 2009
- SD Specification Part E1 SDIO Specification version 3.00, December 16, 2010
- SD Specification Part A2 SD Host Controller Standard Specification version 3.00, February 18, 2010
- SD Specification Part 03 security Specification version 1.01, April 15, 2001

- Embedded MultiMedia Card (eMMC) Product Standard v4.51, JESD84-A451

## **16.4 Register Map**

Refer to [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

Figure 101.Storage Control Cluster Register Map

## 16.5 SDIO for Wifi PCI Configuration Registers

**Table 184. Summary of SDIO for Wifi PCI Configuration Registers—0/17/0**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"Device ID and Vendor ID Register (DEVVENDID)—Offset 0h" on page 1759	00000000h
4–7h	4	"Status and Command Register (STATUSCOMMAND)—Offset 4h" on page 1760	00100000h
8–Bh	4	"Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h" on page 1761	00000000h
C–Fh	4	"Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch" on page 1761	00000000h
10–13h	4	"Base Address Register (BAR)—Offset 10h" on page 1762	00000000h
14–17h	4	"Base Address Register 1 (BAR1)—Offset 14h" on page 1763	00000000h
2C–2Fh	4	"Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch" on page 1764	00000000h
30–33h	4	"Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 1764	00000000h
34–37h	4	"Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h" on page 1765	00000080h
3C–3Fh	4	"Interrupt Register (INTERRUPTREG)—Offset 3Ch" on page 1765	00000100h
80–83h	4	"Power Management Capability ID Register (POWERCAPID)—Offset 80h" on page 1766	48030001h
84–87h	4	"Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h" on page 1766	00000008h
A0–A3h	4	"General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h" on page 1767	00000000h
A4–A7h	4	"General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h" on page 1768	00000000h
A8–ABh	4	"General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h" on page 1768	00000000h
AC–AFh	4	"General Purpose Read Write Register4 (GEN_REGRW4)—Offset Ach" on page 1768	00000000h
C0–C3h	4	"General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h" on page 1769	00000000h
F8–FBh	4	"Manufacturers ID Register (MANID)—Offset F8h" on page 1769	00000000h

### 16.5.1 Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
DEVICEID				VENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Device ID (DEVICEID):</b> Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	<b>Vendor ID (VENDORID):</b> Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

## 16.5.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 4h

**Default:** 00100000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	1	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
Reserved0	RMA	RCA	Reserved1	CAPLIST	INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE	Reserved4	SERR_ENABLE	Reserved5	BME	MSE	Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved0:</b> Reserved.
29	0h RW/1C	<b>Received Master Abort (RMA):</b> If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	<b>Received Target Abort (RCA):</b> If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	<b>Reserved1:</b> Reserved.
20	1h RO	<b>Capabilities List (CAPLIST):</b> Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	<b>Interrupt Status (INTR_STATUS):</b> This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	<b>Reserved2:</b> Reserved.
15:11	00h RO	<b>Reserved3:</b> Reserved.
10	0h RW	<b>Interrupt Disable (INTR_DISABLE):</b> Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	<b>Reserved4:</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	<b>SERR# Enable (SERR_ENABLE):</b> This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	<b>Reserved5:</b> Reserved.
2	0h RW	<b>Bus Master Enable (BME):</b> If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	<b>Memory Space Enable (MSE):</b> This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	<b>Reserved6:</b> Reserved.

### 16.5.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 8h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CLASS_CODES							RID		

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Class Code (CLASS_CODES):</b> This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	<b>Revision ID (RID):</b> Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

### 16.5.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved0:</b> Reserved.
23	0h RO	<b>Multifunction Device (MULFNDEV):</b> This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	<b>Header Type (HEADERTYPE):</b> Implements Type 0 Configuration header.
15:8	00h RO	<b>Latency Timer (LATTIMER):</b> Doesn't apply to PCI Express. Hardwired to 00h.
7:0	00h RW	<b>Cache Line Size (CACHELINE_SIZE):</b> Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

### 16.5.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address (BASEADDR):</b> Base address of the AHB device memory space. Taken from Strap values as 1s.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	<b>Size Indicator (Read Only) (SIZEINDICATOR):</b> Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s.
3	0h RO	<b>Prefetchable (PREFETCHABLE):</b> Indicates that this bar is not prefetchable.
2:1	0h RO	<b>Type (TYPE):</b> '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	<b>Memory Space Indicator (MESSAGE_SPACE):</b> 0 Indicates that this BAR is present in the memory space.

### 16.5.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 14h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
BASEADDR1				SIZEINDICATOR1			PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address Register1 (BASEADDR1):</b> This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0.
11:4	00h RO	<b>Size Indicator1 (SIZEINDICATOR1):</b> Always will be zero as minimum size is 4K.
3	0h RO	<b>Prefetchable (PREFETCHABLE1):</b> Indicates that this bar is not prefetchable.
2:1	0h RO	<b>Type (TYPE1):</b> '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	<b>Memory Space Indicator (MESSAGE_SPACE1):</b> 0 Indicates that this BAR is present in the memory space.

## 16.5.7 Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 2Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID				SUBSYSTEMVENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	<b>Subsystem ID (SUBSYSTEMID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. This register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	<b>Subsystem Vendor ID (SUBSYSTEMVENDORID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

## 16.5.8 Expansion ROM Base Address Register (EXPANSION\_ROM\_BASEADDR)—Offset 30h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 30h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Expansion ROM Base Address (EXPANSION_ROM_BASE):</b> Value of all 0s indicates no support for Expansion ROM.

## 16.5.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 34h

**Default:** 00000080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Reserved0:</b> Reserved.
7:0	80h RO	<b>Capabilities Pointer (CAPPTR_POWER):</b> Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h.

## 16.5.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 3Ch

**Default:** 00000100h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	1	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
MAX_LAT				MIN_GNT				Reserved0	
MAX_LAT				MIN_GNT				INTPIN	
MAX_LAT				MIN_GNT				INTLINE	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Max_Lat (MAX_LAT):</b> Value of 0 indicates that the device has no major requirements for the settings of latency timers.
23:16	00h RO	<b>Min_Gnt (MIN_GNT):</b> Value of 0 indicates that the device has no major requirements for the settings of latency timers.
15:12	0h RO	<b>Reserved0:</b> Reserved.
11:8	1h RO	<b>Interrupt Pin (INTPIN):</b> Each AHB IP on Bridge is a single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	<b>Interrupt Line (INTLINE):</b> Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

## 16.5.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 80h

**Default:** 48030001h

31	28	24	20	16	12	8	4	0							
0	1	0	0	0	1	0	0	0							
0	0	0	0	0	0	0	0	1							
PMESUPPORT					Reserved0				VERSION		NXTCAP			POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	<b>PME_Support (PMESUPPORT):</b> This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	<b>Reserved0:</b> Reserved.
18:16	3h RO	<b>Version (VERSION):</b> Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	<b>Next Capability (NXTCAP):</b> Points to the next capability structure. This points to NULL.
7:0	01h RO	<b>Power Management Capability (POWER_CAP):</b> Indicates this is power management capability.

## 16.5.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 84h

**Default:** 00000008h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	1				
Reserved0				PMESTATUS		Reserved1		PMEENABLE	Reserved2	NO_SOFT_RESET	Reserved3	POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved0:</b> Reserved.
15	0h RW/1C	<b>PME Status (PMESTATUS):</b> 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	<b>Reserved1:</b> Reserved.
8	0h RW	<b>PME Enable (PMEENABLE):</b> A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	<b>Reserved2:</b> Reserved.
3	1h RO	<b>No Soft Reset (NO_SOFT_RESET):</b> This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	<b>Reserved3:</b> Reserved.
1:0	0h RW	<b>Power State (POWERSTATE):</b> This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

### 16.5.13 General Purpose Read Write Register1 (GEN\_REGRW1)—Offset A0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + A0h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GEN_REG_RW1:</b> capabilities over-ride for the sd/sdio/emmc host controller (bits 31:0)

## 16.5.14 General Purpose Read Write Register2 (GEN\_REGRW2)—Offset A4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + A4h

								GEN_REG_RW3	

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GEN_REG_RW3:</b> Reserved.

## 16.5.16 General Purpose Read Write Register4 (GEN\_REGRW4)—Offset ACh

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + ACh

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

### 16.5.17 General Purpose Input Register (GEN\_INPUT\_REGRW)—Offset C0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + C0h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	GEN_REG_INPUT_RW: Reserved.

### 16.5.18 Manufacturers ID Register (MANID)—Offset F8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + F8h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Manufacturer ID (MANID):</b> This register is brought out as straps to the top level.

### 16.6.1 SDMA System Address / Argument 2 Register (SYS\_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p><b>SDMA System Address (sys_adr): (1) SDMA System Address</b>            This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.            The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register.            The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register.            When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer.            When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. <b>(2)</b></p> <p><b>Argument 2</b>            This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.            If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

## 16.6.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>TX_BLK_SIZE_12 (tx_blk_size_12):</b> Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	<p><b>Host SDMA Buffer Boundary (boundary):</b> The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <ul style="list-style-type: none"> <li>• 000b = 4K bytes (Detects A11 carry out)</li> <li>• 001b = 8K bytes (Detects A12 carry out)</li> <li>• 010b = 16K Bytes (Detects A13 carry out)</li> <li>• 011b = 32K Bytes (Detects A14 carry out)</li> <li>• 100b = 64K bytes (Detects A15 carry out)</li> <li>• 101b = 128K Bytes (Detects A16 carry out)</li> <li>• 110b = 256K Bytes (Detects A17 carry out)</li> <li>• 111b = 512K Bytes (Detects A18 carry out)</li> </ul>
11:0	000h RW	<p><b>Transfer Block Size (tr_blk_size):</b> This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 <i>Determining Buffer Block Length</i>). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <ul style="list-style-type: none"> <li>• 0800h = 2048 Bytes</li> <li>• . . .</li> <li>• 0200h = 512 Bytes</li> <li>• 01FFh = 511 Bytes</li> <li>• . . .</li> <li>• 0004h = 4 Bytes</li> <li>• 0003h = 3 Bytes</li> <li>• 0002h = 2 Bytes</li> <li>• 0001h = 1 Byte</li> <li>• 0000h = No data transfer</li> </ul>

### 16.6.3 Block Count Register (BLK\_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 6h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
blk_count				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<p><b>Blocks Count For Current Transfer (blk_count):</b> This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count.</p> <ul style="list-style-type: none"> <li>• 0000h = Stop Count</li> <li>• 0001h = 1 block</li> <li>• 0002h = 2 blocks</li> <li>• ...</li> <li>• FFFFh = 65535 blocks</li> </ul>

#### 16.6.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	<b>Command Argument 1 (argument):</b> The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

#### 16.6.5 Transfer Mode Register (TX\_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

7	0b RW	<b>SPI_MODE (spi_mode):</b> SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	<b>CMD_COMP_ATA (cmd_comp_ata):</b> Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	<b>BLK_SEL (blk_sel):</b> Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	<b>Data Transfer Direction Select (data_tr_dir):</b> This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. <ul style="list-style-type: none"> <li>1 = Read (Card to Host)</li> <li>0 = Write (Host to Card)</li> </ul>
3:2	0b RW	<b>AUTO_CMD_EN (auto_cmd_en):</b> This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	<b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
0	0b RW	<b>DMA Enable (dma_en):</b> This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> <li>1 = DMA Data transfer</li> <li>0 = No data transfer or Non DMA data transfer</li> </ul>

## 16.6.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

### Access Method

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	<b>Rsvd (rsvd):</b> Reserved.
13:8	0h RW	<b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	<b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. <b>(1) Suspend Command</b> If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). <b>(2) Resume Command</b> The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. <b>(3) Abort Command</b> If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> <li>• 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR</li> <li>• 10b = Resume -- CMD52 for writing 'Function Select' in CCCR</li> <li>• 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR</li> <li>• 00b = Normal -- Other commands</li> </ul>
5	0b RW	<b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> <li>• 1 = Data Present</li> <li>• 0 = No Data Present</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	<b>Command Index Check Enable (cmd_index_chk_en):</b> If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
3	0b RW	<b>Command CRC Check Enable (cmd_crc_chk_en):</b> If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
2	0b RO	<b>Reserved (reserved):</b> Reserved.
1:0	0h RW	<b>Response Type Select (resp_type_sel):</b> <ul style="list-style-type: none"> <li>00 = No Response</li> <li>01 = Response Length 136</li> <li>10 = Response Length 48</li> <li>11 = Response Length 48 check Busy after response</li> </ul>

### 16.6.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 10h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved (reserved2):</b> Reserved.
28:25	1111b RO	<b>DAT Line Signal Level (dat_sig_lvl):</b> This status is used to check DAT line level to recover from errors, and for debugging. <ul style="list-style-type: none"> <li>D28 - DAT[7]</li> <li>D27 - DAT[6]</li> <li>D26 - DAT[5]</li> <li>D25 - DAT[4]</li> </ul>
24	1b RO	<b>CMD Line Signal Level (cmd_in_sig_lvl):</b> This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	<b>DAT[3:0] Line Signal Level (data_in_sig_lvl):</b> This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. <ul style="list-style-type: none"> <li>D23 = DAT[3]</li> <li>D22 = DAT[2]</li> <li>D21 = DAT[1]</li> <li>D20 = DAT[0]</li> </ul>
19	1b RO	<b>Write Protect Switch Pin Level (wr_prot_sw_pin_lvl):</b> The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP# pin. <ul style="list-style-type: none"> <li>1 = Write enabled (SDWP#=1)</li> <li>0 = Write protected (SDWP#=0)</li> </ul>
18	1b RO	<b>Card Detect Pin Level (crd_det_pin_lvl):</b> This bit reflects the inverse value of the SDCCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. <ul style="list-style-type: none"> <li>1 = Card present (SDCCD#=0)</li> <li>0 = No card present (SDCCD#=1)</li> </ul>
17	1b RO	<b>Card State Stable (crd_st_stable):</b> This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. No Card state can be detected by this bit being set to 1 while Card Inserted is set to 0. The Software Reset For All in the Software Reset register shall not affect this bit. <ul style="list-style-type: none"> <li>1 = No Card or Inserted</li> <li>0 = Reset or Debouncing</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	<p><b>Card Inserted (crd_ins):</b> This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = Reset or Debouncing or No Card</li> </ul>
15:12	0h RO	<p><b>Reserved1 (reserved1):</b> Reserved.</p>
11	0b RO	<p><b>Buffer Read Enable (buf_rd_en):</b> This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt.</p> <ul style="list-style-type: none"> <li>1 = Read enable</li> <li>0 = Read disable</li> </ul>
10	0b RO	<p><b>Buffer Write Enable (buf_wr_en):</b> This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register.</p> <ul style="list-style-type: none"> <li>1 = Write enable</li> <li>0 = Write disable</li> </ul>
9	0b RO	<p><b>Read Transfer Active (rd_tx_active):</b> This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions:</p> <ul style="list-style-type: none"> <li>After the end bit of the read command.</li> <li>When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared to 0 for either of the following conditions:</p> <ul style="list-style-type: none"> <li>When the last data block as specified by block length is transferred to the System.</li> <li>In case of ADMA2, end of read operation is designated by Descriptor Table.</li> <li>When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1.</li> </ul> <p>A Transfer Complete interrupt is generated when this bit changes to 0.</p> <ul style="list-style-type: none"> <li>1 = Transferring data</li> <li>0 = No valid data</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p><b>Write Transfer Active (wr_tx_active):</b> This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the write command.</li> <li>• When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table.</li> <li>• After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request.</li> </ul> <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <ul style="list-style-type: none"> <li>• 1 Transferring data</li> <li>• 0 No valid data</li> </ul>
7:3	00h RO	<p><b>Reserved (reserved):</b> Reserved.</p>
2	0b RO	<p><b>DAT Line Active (dat_in_active):</b> This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the read command.</li> <li>• When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>• When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request.</li> </ul> <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the write command.</li> <li>• When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>• When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</li> </ul> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> <li>• 1 = DAT Line Active</li> <li>• 0 = DAT Line Inactive</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<p><b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. <b>Note:</b> The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <ul style="list-style-type: none"> <li>1 Cannot issue command which uses the DAT line</li> <li>0 Can issue command which uses the DAT line</li> </ul>
0	0b RO	<p><b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set.</p> <ul style="list-style-type: none"> <li>1 Cannot issue command</li> <li>0 Can issue command using only CMD line</li> </ul>

### 16.6.13 Host Control 1 Register (HOST\_CTL)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00h

7	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lv	sd8_bit_mode	dma_sel	hi_spd_en	data_tx_wid	led_ctl	

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	<p><b>Card Detect Signal Selection (crd_det_sig_sel):</b> This bit selects source for the card detection.</p> <ul style="list-style-type: none"> <li>1 = The Card Detect Test Level is selected (for test purposes)</li> <li>0 = SDCD# is selected (for normal use)</li> </ul> <p>When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during the period of debouncing.</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<b>Card Detect Test Level (crd_det_tst_lvl):</b> This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = No Card</li> </ul>
5	0b RW	<b>SD8 Bit Mode (sd8_bit_mode):</b> This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	<b>DMA Select (dma_sel):</b> One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. <ul style="list-style-type: none"> <li>00 = SDMA is selected</li> <li>01 = Reserved (New assignment is not allowed)</li> <li>10 = 32-bit Address ADMA2 is selected</li> <li>11 = Reserved (will be modified by Version 4.00)</li> </ul>
2	0b RW	<b>High Speed Enable (hi_spd_en):</b> This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. <ul style="list-style-type: none"> <li>1 = 4-bit mode</li> <li>0 = 1-bit mode</li> </ul>
1	0b RW	<b>Data Transfer Width (data_tx_wid):</b> Reserved.
0	0b RW	<b>LED Control (led_ctl):</b> This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. <ul style="list-style-type: none"> <li>1 = 4-bit mode</li> <li>0 = 1-bit mode</li> </ul>

### 16.6.14 Power Control Register (PWR\_CTL)—Offset 29h

#### Access Method

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	<b>Reserved (rsvd):</b> Reserved.
4	0b RW	<b>DRIVE_CCSD (drive_ccsd):</b> If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<p><b>Interrupt at Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.</p> <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>
2	0b RW	<p><b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.</p> <ul style="list-style-type: none"> <li>1 = Enable Read Wait Control</li> <li>0 = Disable Read Wait Control</li> </ul>
1	0b RW	<p><b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <ul style="list-style-type: none"> <li>In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts.</li> <li>In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts.</li> </ul> <p>Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored.</p> <ul style="list-style-type: none"> <li>1 = Restart</li> <li>0 = Not affect</li> </ul>
0	0b RW	<p><b>Stop at Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12.</p> <ul style="list-style-type: none"> <li>1 = Stop</li> <li>0 = Transfer</li> </ul>

### 16.6.16 Wakeup Control Register (WAKEUP\_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

sdclk_freq_sel		upper_sdclk_freq_sel	rsvd	sd_clk_en int_clk_stable int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	<p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. <b>(1) 8-bit Divided Clock Mode</b> This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. <b>(1) 8-bit Divided Clock Mode</b></p> <ul style="list-style-type: none"> <li>• 80h = base clock divided by 256</li> <li>• 40h = base clock divided by 128</li> <li>• 20h = base clock divided by 64</li> <li>• 10h = base clock divided by 32</li> <li>• 08h = base clock divided by 16</li> <li>• 04h = base clock divided by 8</li> <li>• 02h = base clock divided by 4</li> <li>• 01h = base clock divided by 2</li> <li>• 00h = base clock(10MHz and up)</li> </ul> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>• 400KHz divider value</li> <li>• 25MHz divider value</li> <li>• 50MHz divider value</li> </ul> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p><b>(2) 10-bit Divided Clock Mode</b> Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> <li>• 3FFh = 1/2046 Divided Clock</li> <li>• N = 1/2N Divided Clock (Duty 50%)</li> <li>• 002h = 1/4 Divided Clock</li> <li>• 001h = 1/2 Divided Clock</li> <li>• 000h = Base Clock (10MHz and up)</li> <li>• 3FFh = Base Clock * M / 1024</li> <li>• .....</li> <li>• N - 1 = Base Clock * M / N</li> <li>• .....</li> <li>• 002h = Base Clock * M / 3</li> <li>• 001h = Base Clock * M / 2</li> <li>• 000h = Base Clock * M</li> </ul> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	<b>Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel):</b> Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	<b>Rsvd (rsvd):</b> Reserved.
2	0b RW	<b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
1	0b RO	<b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. <b>Note:</b> This is useful when using PLL for a clock oscillator that requires setup time. <ul style="list-style-type: none"> <li>1 = Ready</li> <li>0 = Not Ready</li> </ul>
0	0b RW	<b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. <ul style="list-style-type: none"> <li>1 = Oscillate</li> <li>0 = Stop</li> </ul>

### 16.6.18 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

0	0b RW	<p><b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> <li>• 1 = Reset</li> <li>• 0 = Work</li> </ul> <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>

## 16.6.20 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

### Access Method

12	0b RO	<b>Re-Tuning Event (re_tune):</b> This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. <ul style="list-style-type: none"> <li>1 Re-Tuning should be performed</li> <li>0 Re-Tuning is not required</li> </ul>
11	0b RO	<b>INT_C (int_c):</b> This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_C is detected</li> <li>0 = No interrupt is detected</li> </ul>
10	0b RO	<b>INT_B (int_b):</b> This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_B is detected</li> <li>0 = No interrupt is detected</li> </ul>
9	0b RO	<b>INT_A (int_a):</b> This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_A is detected</li> <li>0 = No interrupt is detected</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p><b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> <li>• 1 = Generate Card Interrupt</li> <li>• 0 = No Card Interrupt</li> </ul>
7	0b RW/1C	<p><b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>• 1 = Card removed</li> <li>• 0 = Card state stable or Debouncing</li> </ul>
6	0b RW/1C	<p><b>Card Insertion (crd_ins):</b> This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>• 1 Card inserted</li> <li>• 0 Card state stable or Debouncing</li> </ul>
5	0b RW/1C	<p><b>Buffer Read Ready (buf_rd_rdy):</b> This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution.</p> <ul style="list-style-type: none"> <li>• 1 = Ready to read buffer</li> <li>• 0 = Not ready to read buffer</li> </ul>
4	0b RW/1C	<p><b>Buffer Write Ready (buf_wr_rdy):</b> This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register.</p> <ul style="list-style-type: none"> <li>• 1 = Ready to write buffer</li> <li>• 0 = Not ready to write buffer</li> </ul>
3	0b RW/1C	<p><b>DMA Interrupt (dma_int):</b> This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete.</p> <ul style="list-style-type: none"> <li>• 1 = DMA Interrupt is generated</li> <li>• 0 = No DMA Interrupt</li> </ul>
2	0b RW/1C	<p><b>Block Gap Event (blk_gap_event):</b> If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p1<b>(1)</b> <b>In the case of a Write Transaction</b> This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> <li>• 1 = Transaction stopped at block gap</li> <li>• 0 = No Block Gap Event</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	<p><b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. <b>(2) In the case of a Write Transaction</b> This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. <b>(3) In the case of a command with busy</b> This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> <li>• 1 = Command execution is completed</li> <li>• 0 = Not complete</li> </ul> <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p>
0	0b RW/1C	<p><b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> <li>• 1 = Command complete</li> <li>• 0 = No command complete</li> </ul>

### 16.6.21 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>Vendor Specific Error Status (vend_spec_err_status):</b> Reserved.
14	0b RW	<b>Boot Command Timeout Error (boot_cmd_timeout_err):</b> Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	<b>CEATA Error (ceata_err):</b> Occurs when ATA command termination has occurred due to an error condition the device has encountered.
12	0b RW	<b>Target Response Error (tgt_rsp_err):</b> Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	<b>Reserved (rsvd):</b> Reserved.
9	0b RW	<b>ADMA Error (adma_err):</b> This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. <b>ADMA Error State</b> in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. <ul style="list-style-type: none"> <li>0 = error</li> <li>1 = no error</li> </ul>
8	0b RW	<b>Auto CMD12 Error (cmd12_err):</b> Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
7	0b RW	<b>Current Limit Error (cur_limit_err):</b> By setting the <b>SD Bus Power</b> bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. <ul style="list-style-type: none"> <li>1 = power fail</li> <li>0 = no error</li> </ul>
6	0b RW	<b>Data End Bit Error (data_end_bit_err):</b> Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
5	0b RW	<b>Data CRC Error (data_crc_err):</b> Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	<b>Data Timeout Error (data_timeout_err):</b> This bit is set when detecting one of following timeout conditions. <ul style="list-style-type: none"> <li>Busy timeout for R1b,R5b type</li> <li>Busy timeout after Write CRC status</li> <li>Write CRC Status timeout</li> <li>Read Data timeout</li> </ul> <ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no error</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<b>Command Index Error (cmd_index_err):</b> This bit is set if a Command Index error occurs in the command response. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
2	0b RW	<b>Command End Bit Error (cmd_end_bit_err):</b> This bit is set when detecting that the end bit of a command response is 0. <ul style="list-style-type: none"> <li>1 = End Bit Error generated</li> <li>0 = no error</li> </ul>
1	0b RW	<b>Command CRC Error (cmd_crc_err): Command CRC Error</b> is generated in two cases. If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between <b>Command CRC Error</b> and <b>Command Timeout Error</b> ). <ul style="list-style-type: none"> <li>1 = CRC Error Generated.</li> <li>0 = no error</li> </ul>
0	0b RW	<b>Command Timeout Error (cmd_timeout_err):</b> This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case <b>Command CRC Error</b> shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and <b>Command CRC Error</b> ) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. <ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no Error</li> </ul>

### 16.6.22 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

#### Access Method

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Preset Value (preset_value):</b> Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. <ul style="list-style-type: none"> <li>1 = Automatic Selection by Preset Value are Enabled</li> <li>0 SDCLK and Driver Strength are controlled by Host Driver</li> </ul> If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	<b>Asynchronous Interrupt (async_int):</b> This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this bit to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete. <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>

### 16.6.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

**Note:** By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 52h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

### 16.6.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.

- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 54h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

Reserved0	RMA	RCA	Reserved1	CAPLIST	INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE	Reserved4	SERR_ENABLE	Reserved5	BME	MSE	Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved0:</b> Reserved.
29	0h RW/1C	<b>Received Master Abort (RMA):</b> If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	<b>Received Target Abort (RCA):</b> If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	<b>Reserved1:</b> Reserved.
20	1h RO	<b>Capabilities List (CAPLIST):</b> Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	<b>Interrupt Status (INTR_STATUS):</b> This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	<b>Reserved2:</b> Reserved.
15:11	00h RO	<b>Reserved3:</b> Reserved.
10	0h RW	<b>Interrupt Disable (INTR_DISABLE):</b> Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	<b>Reserved4:</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	<b>SERR# Enable (SERR_ENABLE):</b> This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	<b>Reserved5:</b> Reserved.
2	0h RW	<b>Bus Master Enable (BME):</b> If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	<b>Memory Space Enable (MSE):</b> This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	<b>Reserved6:</b> Reserved.

### 16.7.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 8h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CLASS_CODES								RID											

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Class Code (CLASS_CODES):</b> This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	<b>Revision ID (RID):</b> Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

### 16.7.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + Ch

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved0:</b> Reserved.
23	0h RO	<b>Multifunction Device (MULFNDEV):</b> This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	<b>Header Type (HEADERTYPE):</b> Implements Type 0 Configuration header.
15:8	00h RO	<b>Latency Timer (LATTIMER):</b> Doesnt apply to PCI Express. Hardwired to 00h.
7:0	00h RW	<b>Cache Line Size (CACHELINE_SIZE):</b> Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

### 16.7.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address (BASEADDR):</b> Base address of the AHB device memory space. Taken from Strap values as 1s.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	<b>Size Indicator (Read Only) (SIZEINDICATOR)</b> : Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s.
3	0h RO	<b>Prefetchable (PREFETCHABLE)</b> : Indicates that this bar is not prefetchable.
2:1	0h RO	<b>Type (TYPE)</b> : '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	<b>Memory Space Indicator (MESSAGE_SPACE)</b> : 0 Indicates that this BAR is present in the memory space.

### 16.7.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 14h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
BASEADDR1						SIZEINDICATOR1		PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address Register1 (BASEADDR1)</b> : This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0.
11:4	00h RO	<b>Size Indicator1 (SIZEINDICATOR1)</b> : Always will be zero as minimum size is 4K.
3	0h RO	<b>Prefetchable (PREFETCHABLE1)</b> : Indicates that this bar is not prefetchable.
2:1	0h RO	<b>Type (TYPE1)</b> : '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	<b>Memory Space Indicator (MESSAGE_SPACE1)</b> : 0 Indicates that this BAR is present in the memory space.

## 16.7.7 Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 2Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID				SUBSYSTEMVENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	<b>Subsystem ID (SUBSYSTEMID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	<b>Subsystem Vendor ID (SUBSYSTEMVENDORID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

## 16.7.8 Expansion ROM Base Address Register (EXPANSION\_ROM\_BASEADDR)—Offset 30h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 30h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Expansion ROM Base Address (EXPANSION_ROM_BASE):</b> Value of all 0s indicates no support for Expansion ROM.

## 16.7.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 34h

**Default:** 00000080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Reserved0:</b> Reserved.
7:0	80h RO	<b>Capabilities Pointer (CAPPTR_POWER):</b> Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h.

## 16.7.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 3Ch

**Default:** 00000100h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	1	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
MAX_LAT				MIN_GNT				Reserved0	INTPIN	INTLINE	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Max_Lat (MAX_LAT):</b> Value of 0 indicates that the device has no major requirements for the settings of latency timers.
23:16	00h RO	<b>Min_Gnt (MIN_GNT):</b> Value of 0 indicates that the device has no major requirements for the settings of latency timers.
15:12	0h RO	<b>Reserved0:</b> Reserved.
11:8	1h RO	<b>Interrupt Pin (INTPIN):</b> Each AHB IP on Bridge is a single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	<b>Interrupt Line (INTLINE):</b> Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

## 16.7.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 80h

**Default:** 48030001h

31	28	24	20	16	12	8	4	0							
0	1	0	0	0	1	0	0	0							
0	0	0	0	0	0	0	0	1							
PMESUPPORT					Reserved0				VERSION		NXTCAP			POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	<b>PME_Support (PMESUPPORT):</b> This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	<b>Reserved0:</b> Reserved.
18:16	3h RO	<b>Version (VERSION):</b> Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	<b>Next Capability (NXTCAP):</b> Points to the next capability structure. This points to NULL.
7:0	01h RO	<b>Power Management Capability (POWER_CAP):</b> Indicates this is power management capability.

## 16.7.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 84h

**Default:** 00000008h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	1				
Reserved0				PMESTATUS		Reserved1		PMEENABLE	Reserved2	NO_SOFT_RESET	Reserved3	POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved0:</b> Reserved.
15	0h RW/1C	<b>PME Status (PMESTATUS):</b> 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	<b>Reserved1:</b> Reserved.
8	0h RW	<b>PME Enable (PMEENABLE):</b> A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	<b>Reserved2:</b> Reserved.
3	1h RO	<b>No Soft Reset (NO_SOFT_RESET):</b> This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	<b>Reserved3:</b> Reserved.
1:0	0h RW	<b>Power State (POWERSTATE):</b> This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

### 16.7.13 General Purpose Read Write Register1 (GEN\_REGRW1)—Offset A0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + A0h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GEN_REG_RW1:</b> capabilities over-ride for the sd/sdio/emmc host controller (bits 31:0)

## 16.7.14 General Purpose Read Write Register2 (GEN\_REGRW2)—Offset A4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + A4h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
CAP_REG_SEL								GEN_REG_RW2	

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>CAP_REG_SEL:</b> select if the capability will come from the GEN PCI register or from a hard wire
30:0	0h RW	<b>GEN_REG_RW2:</b> capabilities over-ride for the sd/sdio/emmc host controller (bits 62:32)

## 16.7.15 General Purpose Read Write Register3 (GEN\_REGRW3)—Offset A8h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + A8h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
								GEN_REG_RW3	

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GEN_REG_RW3:</b> Reserved.

## 16.7.16 General Purpose Read Write Register4 (GEN\_REGRW4)—Offset ACh

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + ACh

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

### 16.7.17 General Purpose Input Register (GEN\_INPUT\_REGRW)—Offset C0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + C0h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	GEN_REG_INPUT_RW: Reserved.

### 16.7.18 Manufacturers ID Register (MANID)—Offset F8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + F8h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Manufacturer ID (MANID):</b> This register is brought out as straps to the top level.

## 16.8 SD Card Memory Mapped IO Registers

**Table 187. Summary of SD Card Memory Mapped I/O Registers—BAR**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1828	00000000h
4–5h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1829	0000h
6–7h	2	"Block Count Register (BLK_COUNT)—Offset 6h" on page 1830	0000h
8–Bh	4	"Argument 1 Register (ARGUMENT)—Offset 8h" on page 1831	00000000h
C–Dh	2	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 1831	0000h
E–Fh	2	"Command Register (CMD)—Offset Eh" on page 1833	0000h
10–13h	4	"Response Register 0 (RESPONSE0)—Offset 10h" on page 1834	00000000h
14–17h	4	"Response Register 2 (RESPONSE2)—Offset 14h" on page 1835	00000000h
18–1Bh	4	"Response Register 4 (RESPONSE4)—Offset 18h" on page 1835	00000000h
1C–1Fh	4	"Response Register 6 (RESPONSE6)—Offset 1Ch" on page 1836	00000000h
20–23h	4	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 1836	00000000h
24–27h	4	"Present State Register (PRE_STATE)—Offset 24h" on page 1837	1FFF0000h
28–28h	1	"Host Control 1 Register (HOST_CTL)—Offset 28h" on page 1840	00h
29–29h	1	"Power Control Register (PWR_CTL)—Offset 29h" on page 1841	00h
2A–2Ah	1	"Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah" on page 1842	00h
2B–2Bh	1	"Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh" on page 1843	00h
2C–2Dh	2	"Clock Control Register (CLK_CTL)—Offset 2Ch" on page 1844	0000h
2E–2Eh	1	"Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh" on page 1846	00h
2F–2Fh	1	"Software Reset Register (SW_RST)—Offset 2Fh" on page 1847	00h
30–31h	2	"Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h" on page 1848	0000h
32–33h	2	"Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h" on page 1851	0000h
34–35h	2	"Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h" on page 1853	0000h
36–37h	2	"Error Interrupt Status Enable Register (ERR_INT_STAT_EN)—Offset 36h" on page 1855	0000h
38–39h	2	"Normal Interrupt Signal Enable Register (NRM_INT_SIG_EN)—Offset 38h" on page 1856	0000h
3A–3Bh	2	"Error Interrupt Signal Enable Register (ERR_INT_SIG_EN)—Offset 3Ah" on page 1857	0000h
3C–3Fh	4	"Auto CMD12 Error Status Register and Host Control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch" on page 1859	00000000h
40–43h	4	"Capabilities Register (CAPABILITIES)—Offset 40h" on page 1860	00000000h

48–4Bh	4	"Maximum Current Capabilities Register (MAX_CUR_CAP)—Offset 48h" on page 1861	00000000h
50–51h	2	"Force Event Register for Auto CMD12 Error Status (FORCE_EVENT_CMD12_ERR_STAT)—Offset 50h" on page 1862	0000h

**Table 187. Summary of SD Card Memory Mapped I/O Registers—BAR (Continued)**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
52–53h	2	"Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h" on page 1863	0000h
54–54h	1	"ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h" on page 1864	00h
58–5Bh	4	"ADMA System Address Register (ADMA_SYS_ADDR)—Offset 58h" on page 1865	00000000h
70–73h	4	"Boot Timeout Control (BOOT_TIMEOUT_CTRL)—Offset 70h" on page 1866	00000000h
74–74h	1	"Debug Selection Register (DEBUG_SEL)—Offset 74h" on page 1866	00h
E0–E3h	4	"Shared Bus Control Register (SHARED_BUS)—Offset E0h" on page 1867	00000000h
F0–F0h	1	"SPI Interrupt Support Register (SPI_INT_SUP)—Offset F0h" on page 1869	00h
FC–FDh	2	"Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh" on page 1869	0000h
FE–FFh	2	"Host Controller Version Register (HOST_CTRL_VER)—Offset FEh" on page 1870	B502h

### 16.8.1 SDMA System Address / Argument 2 Register (SYS\_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p><b>SDMA System Address (sys_adr): (1) SDMA System Address</b>            This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.            The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register.            The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register.            When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer.            When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. <b>(2)</b></p> <p><b>Argument 2</b>            This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.            If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

## 16.8.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>TX_BLK_SIZE_12 (tx_blk_size_12):</b> Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	<p><b>Host SDMA Buffer Boundary (boundary):</b> The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <ul style="list-style-type: none"> <li>• 000b = 4K bytes (Detects A11 carry out)</li> <li>• 001b = 8K bytes (Detects A12 carry out)</li> <li>• 010b = 16K Bytes (Detects A13 carry out)</li> <li>• 011b = 32K Bytes (Detects A14 carry out)</li> <li>• 100b = 64K bytes (Detects A15 carry out)</li> <li>• 101b = 128K Bytes (Detects A16 carry out)</li> <li>• 110b = 256K Bytes (Detects A17 carry out)</li> <li>• 111b = 512K Bytes (Detects A18 carry out)</li> </ul>
11:0	000h RW	<p><b>Transfer Block Size (tr_blk_size):</b> This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 <i>Determining Buffer Block Length</i>). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <ul style="list-style-type: none"> <li>• 0800h = 2048 Bytes</li> <li>• . . .</li> <li>• 0200h = 512 Bytes</li> <li>• 01FFh = 511 Bytes</li> <li>• . . .</li> <li>• 0004h = 4 Bytes</li> <li>• 0003h = 3 Bytes</li> <li>• 0002h = 2 Bytes</li> <li>• 0001h = 1 Byte</li> <li>• 0000h = No data transfer</li> </ul>

### 16.8.3 Block Count Register (BLK\_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 6h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
blk_count				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<p><b>Blocks Count For Current Transfer (blk_count):</b> This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count.</p> <ul style="list-style-type: none"> <li>• 0000h = Stop Count</li> <li>• 0001h = 1 block</li> <li>• 0002h = 2 blocks</li> <li>• ...</li> <li>• FFFFh = 65535 blocks</li> </ul>

#### 16.8.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	<b>Command Argument 1 (argument):</b> The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

#### 16.8.5 Transfer Mode Register (TX\_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

1	0b RW	<b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
0	0b RW	<b>DMA Enable (dma_en):</b> This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> <li>1 = DMA Data transfer</li> <li>0 = No data transfer or Non DMA data transfer</li> </ul>

## 16.8.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

15	12	8	4	0

rsvd	cmd_index	cmd_type	data_pr_sel cmd_index_chk_en cmd_crc_chk_en	reserved resp_type_sel

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	<b>Rsvd (rsvd):</b> Reserved.
13:8	0h RW	<b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	<b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. <b>(1) Suspend Command</b> If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). <b>(2) Resume Command</b> The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. <b>(3) Abort Command</b> If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> <li>• 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR</li> <li>• 10b = Resume -- CMD52 for writing 'Function Select' in CCCR</li> <li>• 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR</li> <li>• 00b = Normal -- Other commands</li> </ul>
5	0b RW	<b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> <li>• 1 = Data Present</li> <li>• 0 = No Data Present</li> </ul>

buf_data								

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	<b>Buffer Data (buf_data):</b> The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to section 1.7.

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	<p><b>Card Inserted (crd_ins):</b> This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = Reset or Debouncing or No Card</li> </ul>
15:12	0h RO	<p><b>Reserved1 (reserved1):</b> Reserved.</p>
11	0b RO	<p><b>Buffer Read Enable (buf_rd_en):</b> This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt.</p> <ul style="list-style-type: none"> <li>1 = Read enable</li> <li>0 = Read disable</li> </ul>
10	0b RO	<p><b>Buffer Write Enable (buf_wr_en):</b> This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register.</p> <ul style="list-style-type: none"> <li>1 = Write enable</li> <li>0 = Write disable</li> </ul>
9	0b RO	<p><b>Read Transfer Active (rd_tx_active):</b> This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions:</p> <ul style="list-style-type: none"> <li>After the end bit of the read command.</li> <li>When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared to 0 for either of the following conditions:</p> <ul style="list-style-type: none"> <li>When the last data block as specified by block length is transferred to the System.</li> <li>In case of ADMA2, end of read operation is designated by Descriptor Table.</li> <li>When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1.</li> </ul> <p>A Transfer Complete interrupt is generated when this bit changes to 0.</p> <ul style="list-style-type: none"> <li>1 = Transferring data</li> <li>0 = No valid data</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p><b>Write Transfer Active (wr_tx_active):</b> This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the write command.</li> <li>• When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table.</li> <li>• After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request.</li> </ul> <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <ul style="list-style-type: none"> <li>• 1 Transferring data</li> <li>• 0 No valid data</li> </ul>
7:3	00h RO	<b>Reserved (reserved):</b> Reserved.
2	0b RO	<p><b>DAT Line Active (dat_in_active):</b> This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the read command.</li> <li>• When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>• When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request.</li> </ul> <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the write command.</li> <li>• When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>• When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</li> </ul> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> <li>• 1 = DAT Line Active</li> <li>• 0 = DAT Line Inactive</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<p><b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. <b>Note:</b> The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <ul style="list-style-type: none"> <li>1 Cannot issue command which uses the DAT line</li> <li>0 Can issue command which uses the DAT line</li> </ul>
0	0b RO	<p><b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set.</p> <ul style="list-style-type: none"> <li>1 Cannot issue command</li> <li>0 Can issue command using only CMD line</li> </ul>

### 16.8.13 Host Control 1 Register (HOST\_CTL)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

7	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lv	sd8_bit_mode	dma_sel	hi_spd_en	data_tx_wid	led_ctl	

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	<p><b>Card Detect Signal Selection (crd_det_sig_sel):</b> This bit selects source for the card detection.</p> <ul style="list-style-type: none"> <li>1 = The Card Detect Test Level is selected (for test purposes)</li> <li>0 = SDCD# is selected (for normal use)</li> </ul> <p>When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during the period of debouncing.</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<b>Card Detect Test Level (crd_det_tst_lvl):</b> This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = No Card</li> </ul>
5	0b RW	<b>SD8 Bit Mode (sd8_bit_mode):</b> This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	<b>DMA Select (dma_sel):</b> One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. <ul style="list-style-type: none"> <li>00 = SDMA is selected</li> <li>01 = Reserved (New assignment is not allowed)</li> <li>10 = 32-bit Address ADMA2 is selected</li> <li>11 = Reserved (will be modified by Version 4.00)</li> </ul>
2	0b RW	<b>High Speed Enable (hi_spd_en):</b> This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. <ul style="list-style-type: none"> <li>1 = 4-bit mode</li> <li>0 = 1-bit mode</li> </ul>
1	0b RW	<b>Data Transfer Width (data_tx_wid):</b> Reserved.
0	0b RW	<b>LED Control (led_ctl):</b> This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. <ul style="list-style-type: none"> <li>1 = 4-bit mode</li> <li>0 = 1-bit mode</li> </ul>

### 16.8.14 Power Control Register (PWR\_CTL)—Offset 29h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 29h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	<b>HW Reset (hw_rst):</b> Reserved.
3:1	0h RW	<b>SD Bus Voltage Select (sd_bus_volt_sel):</b> By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the Voltage Support bits in the Capabilities register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage. <ul style="list-style-type: none"> <li>• 111b = 3.3V (Typ.)</li> <li>• 110b = 3.0V (Typ.)</li> <li>• 101b = 1.8V (Typ.)</li> <li>• 100b 000b Reserved</li> </ul>
0	0b RW	<b>SD Bus Power (sd_bus_pwr):</b> Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. <ul style="list-style-type: none"> <li>• 1 = Power on</li> <li>• 0 = Power off</li> </ul>

### 16.8.15 Block Gap Control Register (\_BLK\_GAP\_CTL)—Offset 2Ah

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Ah

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

7	0	0	0	4	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req	

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	<b>Reserved (rsvd):</b> Reserved.
4	0b RW	<b>DRIVE_CCSD (drive_ccsd):</b> If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<p><b>Interrupt at Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.</p> <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>
2	0b RW	<p><b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.</p> <ul style="list-style-type: none"> <li>1 = Enable Read Wait Control</li> <li>0 = Disable Read Wait Control</li> </ul>
1	0b RW	<p><b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <ul style="list-style-type: none"> <li>In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts.</li> <li>In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts.</li> </ul> <p>Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored.</p> <ul style="list-style-type: none"> <li>1 = Restart</li> <li>0 = Not affect</li> </ul>
0	0b RW	<p><b>Stop at Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12.</p> <ul style="list-style-type: none"> <li>1 = Stop</li> <li>0 = Transfer</li> </ul>

### 16.8.16 Wakeup Control Register (WAKEUP\_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

#### Access Method

### 16.8.17 Clock Control Register (CLK\_CTL)—Offset 2Ch

At the initialization of the Host Controller, the Host Driver shall set the SDCLK Frequency Select according to the Capabilities register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 2Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
sdclk_freq_sel		upper_sdclk_freq_sel	rsvd	sd_clk_en int_clk_stable int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	<p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. <b>(1) 8-bit Divided Clock Mode</b> This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. <b>(1) 8-bit Divided Clock Mode</b></p> <ul style="list-style-type: none"> <li>• 80h = base clock divided by 256</li> <li>• 40h = base clock divided by 128</li> <li>• 20h = base clock divided by 64</li> <li>• 10h = base clock divided by 32</li> <li>• 08h = base clock divided by 16</li> <li>• 04h = base clock divided by 8</li> <li>• 02h = base clock divided by 4</li> <li>• 01h = base clock divided by 2</li> <li>• 00h = base clock(10MHz and up)</li> </ul> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>• 400KHz divider value</li> <li>• 25MHz divider value</li> <li>• 50MHz divider value</li> </ul> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p><b>(2) 10-bit Divided Clock Mode</b> Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> <li>• 3FFh = 1/2046 Divided Clock</li> <li>• N = 1/2N Divided Clock (Duty 50%)</li> <li>• 002h = 1/4 Divided Clock</li> <li>• 001h = 1/2 Divided Clock</li> <li>• 000h = Base Clock (10MHz and up)</li> <li>• 3FFh = Base Clock * M / 1024</li> <li>• .....</li> <li>• N - 1 = Base Clock * M / N</li> <li>• .....</li> <li>• 002h = Base Clock * M / 3</li> <li>• 001h = Base Clock * M / 2</li> <li>• 000h = Base Clock * M</li> </ul> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	<b>Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel):</b> Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	<b>Rsvd (rsvd):</b> Reserved.
2	0b RW	<b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
1	0b RO	<b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. <b>Note:</b> This is useful when using PLL for a clock oscillator that requires setup time. <ul style="list-style-type: none"> <li>1 = Ready</li> <li>0 = Not Ready</li> </ul>
0	0b RW	<b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. <ul style="list-style-type: none"> <li>1 = Oscillate</li> <li>0 = Stop</li> </ul>

### 16.8.18 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

0	0b RW	<p><b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> <li>• 1 = Reset</li> <li>• 0 = Work</li> </ul> <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>

## 16.8.20 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

### Access Method

12	0b RO	<b>Re-Tuning Event (re_tune):</b> This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. <ul style="list-style-type: none"> <li>1 Re-Tuning should be performed</li> <li>0 Re-Tuning is not required</li> </ul>
11	0b RO	<b>INT_C (int_c):</b> This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_C is detected</li> <li>0 = No interrupt is detected</li> </ul>
10	0b RO	<b>INT_B (int_b):</b> This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_B is detected</li> <li>0 = No interrupt is detected</li> </ul>
9	0b RO	<b>INT_A (int_a):</b> This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_A is detected</li> <li>0 = No interrupt is detected</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p><b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> <li>• 1 = Generate Card Interrupt</li> <li>• 0 = No Card Interrupt</li> </ul>
7	0b RW/1C	<p><b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>• 1 = Card removed</li> <li>• 0 = Card state stable or Debouncing</li> </ul>
6	0b RW/1C	<p><b>Card Insertion (crd_ins):</b> This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>• 1 Card inserted</li> <li>• 0 Card state stable or Debouncing</li> </ul>
5	0b RW/1C	<p><b>Buffer Read Ready (buf_rd_rdy):</b> This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution.</p> <ul style="list-style-type: none"> <li>• 1 = Ready to read buffer</li> <li>• 0 = Not ready to read buffer</li> </ul>
4	0b RW/1C	<p><b>Buffer Write Ready (buf_wr_rdy):</b> This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register.</p> <ul style="list-style-type: none"> <li>• 1 = Ready to write buffer</li> <li>• 0 = Not ready to write buffer</li> </ul>
3	0b RW/1C	<p><b>DMA Interrupt (dma_int):</b> This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete.</p> <ul style="list-style-type: none"> <li>• 1 = DMA Interrupt is generated</li> <li>• 0 = No DMA Interrupt</li> </ul>
2	0b RW/1C	<p><b>Block Gap Event (blk_gap_event):</b> If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p1<b>(1)</b> <b>In the case of a Write Transaction</b> This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> <li>• 1 = Transaction stopped at block gap</li> <li>• 0 = No Block Gap Event</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	<p><b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. <b>(2) In the case of a Write Transaction</b> This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. <b>(3) In the case of a command with busy</b> This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> <li>• 1 = Command execution is completed</li> <li>• 0 = Not complete</li> </ul> <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p>
0	0b RW/1C	<p><b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> <li>• 1 = Command complete</li> <li>• 0 = No command complete</li> </ul>

### 16.8.21 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 32h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

				data_timeout_err
				cmd_index_err
				cmd_end_bit_err
				cmd_crc_err
				cmd_timeout_err

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>Vendor Specific Error Status (vend_spec_err_status):</b> Reserved.
14	0b RW	<b>Boot Command Timeout Error (boot_cmd_timeout_err):</b> Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	<b>CEATA Error (ceata_err):</b> Occurs when ATA command termination has occurred due to an error condition the device has encountered.
12	0b RW	<b>Target Response Error (tgt_rsp_err):</b> Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	<b>Reserved (rsvd):</b> Reserved.
9	0b RW	<b>ADMA Error (adma_err):</b> This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. <b>ADMA Error State</b> in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. <ul style="list-style-type: none"> <li>0 = error</li> <li>1 = no error</li> </ul>
8	0b RW	<b>Auto CMD12 Error (cmd12_err):</b> Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
7	0b RW	<b>Current Limit Error (cur_limit_err):</b> By setting the <b>SD Bus Power</b> bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. <ul style="list-style-type: none"> <li>1 = power fail</li> <li>0 = no error</li> </ul>
6	0b RW	<b>Data End Bit Error (data_end_bit_err):</b> Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
5	0b RW	<b>Data CRC Error (data_crc_err):</b> Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	<b>Data Timeout Error (data_timeout_err):</b> This bit is set when detecting one of following timeout conditions. <ul style="list-style-type: none"> <li>Busy timeout for R1b,R5b type</li> <li>Busy timeout after Write CRC status</li> <li>Write CRC Status timeout</li> <li>Read Data timeout</li> </ul> <ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no error</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<b>Command Index Error (cmd_index_err):</b> This bit is set if a Command Index error occurs in the command response. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
2	0b RW	<b>Command End Bit Error (cmd_end_bit_err):</b> This bit is set when detecting that the end bit of a command response is 0. <ul style="list-style-type: none"> <li>1 = End Bit Error generated</li> <li>0 = no error</li> </ul>
1	0b RW	<b>Command CRC Error (cmd_crc_err): Command CRC Error</b> is generated in two cases. If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between <b>Command CRC Error</b> and <b>Command Timeout Error</b> ). <ul style="list-style-type: none"> <li>1 = CRC Error Generated.</li> <li>0 = no error</li> </ul>
0	0b RW	<b>Command Timeout Error (cmd_timeout_err):</b> This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case <b>Command CRC Error</b> shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and <b>Command CRC Error</b> ) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. <ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no Error</li> </ul>

### 16.8.22 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

#### Access Method

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Preset Value (preset_value):</b> Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. <ul style="list-style-type: none"> <li>1 = Automatic Selection by Preset Value are Enabled</li> <li>0 SDCLK and Driver Strength are controlled by Host Driver</li> </ul> If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	<b>Asynchronous Interrupt (async_int):</b> This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this bit to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete. <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>

## 16.8.27 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RO	<b>Capabilities (capabilities):</b> Reserved.

### 16.8.28 Capabilities Register 2 (CAPABILITIES\_2)—Offset 44h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RO	<b>Capabilities 2 (capabilities_2):</b> Reserved.

### 16.8.29 Maximum Current Capabilities Register (MAX\_CUR\_CAP)—Offset 48h

These registers indicate maximum current capability for each voltage. The value is meaningful if Voltage Support is set in the Capabilities register. If this information is supplied by the Host System via another method, all Maximum Current Capabilities register shall be 0.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 48h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

### 16.8.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

**Note:** By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register

### 16.8.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.

- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 54h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

### 16.9.1 Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DEVICEID				VENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Device ID (DEVICEID):</b> Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	<b>Vendor ID (VENDORID):</b> Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

## 16.9.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 4h

**Default:** 00100000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	1	0	0	0	0	0						
Reserved0	RMA	RCA	Reserved1	CAPLIST	INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE	Reserved4	SERR_ENABLE	Reserved5	BME	MSE	Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved0:</b> Reserved.
29	0h RW/1C	<b>Received Master Abort (RMA):</b> If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	<b>Received Target Abort (RCA):</b> If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	<b>Reserved1:</b> Reserved.
20	1h RO	<b>Capabilities List (CAPLIST):</b> Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	<b>Interrupt Status (INTR_STATUS):</b> This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	<b>Reserved2:</b> Reserved.
15:11	00h RO	<b>Reserved3:</b> Reserved.
10	0h RW	<b>Interrupt Disable (INTR_DISABLE):</b> Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	<b>Reserved4:</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	<b>SERR# Enable (SERR_ENABLE):</b> This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	<b>Reserved5:</b> Reserved.
2	0h RW	<b>Bus Master Enable (BME):</b> If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	<b>Memory Space Enable (MSE):</b> This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	<b>Reserved6:</b> Reserved.

### 16.9.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 8h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CLASS_CODES							RID		

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Class Code (CLASS_CODES):</b> This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	<b>Revision ID (RID):</b> Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

### 16.9.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + Ch

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved0:</b> Reserved.
23	0h RO	<b>Multifunction Device (MULFNDEV):</b> This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	<b>Header Type (HEADERTYPE):</b> Implements Type 0 Configuration header.
15:8	00h RO	<b>Latency Timer (LATTIMER):</b> Doesnt apply to PCI Express. Hardwired to 00h.
7:0	00h RW	<b>Cache Line Size (CACHELINE_SIZE):</b> Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

### 16.9.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address (BASEADDR):</b> Base address of the AHB device memory space. Taken from Strap values as 1s.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	<b>Size Indicator (Read Only) (SIZEINDICATOR)</b> : Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s.
3	0h RO	<b>Prefetchable (PREFETCHABLE)</b> : Indicates that this bar is not prefetchable.
2:1	0h RO	<b>Type (TYPE)</b> : '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	<b>Memory Space Indicator (MESSAGE_SPACE)</b> : 0 Indicates that this BAR is present in the memory space.

### 16.9.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 14h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
BASEADDR1						SIZEINDICATOR1		PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address Register1 (BASEADDR1)</b> : This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0.
11:4	00h RO	<b>Size Indicator1 (SIZEINDICATOR1)</b> : Always will be zero as minimum size is 4K.
3	0h RO	<b>Prefetchable (PREFETCHABLE1)</b> : Indicates that this bar is not prefetchable.
2:1	0h RO	<b>Type (TYPE1)</b> : '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	<b>Memory Space Indicator (MESSAGE_SPACE1)</b> : 0 Indicates that this BAR is present in the memory space.

## 16.9.7 Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 2Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID				SUBSYSTEMVENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	<b>Subsystem ID (SUBSYSTEMID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. This register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	<b>Subsystem Vendor ID (SUBSYSTEMVENDORID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

## 16.9.8 Expansion ROM Base Address Register (EXPANSION\_ROM\_BASEADDR)—Offset 30h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 30h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Expansion ROM Base Address (EXPANSION_ROM_BASE):</b> Value of all 0s indicates no support for Expansion ROM.

## 16.9.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 34h

**Default:** 00000080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Reserved0:</b> Reserved.
7:0	80h RO	<b>Capabilities Pointer (CAPPTR_POWER):</b> Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h.

## 16.9.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 3Ch

**Default:** 00000100h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	1	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
MAX_LAT				MIN_GNT				Reserved0	
MAX_LAT				MIN_GNT				INTPIN	
MAX_LAT				MIN_GNT				INTLINE	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Max_Lat (MAX_LAT):</b> Value of 0 indicates that the device has no major requirements for the settings of latency timers.
23:16	00h RO	<b>Min_Gnt (MIN_GNT):</b> Value of 0 indicates that the device has no major requirements for the settings of latency timers.
15:12	0h RO	<b>Reserved0:</b> Reserved.
11:8	1h RO	<b>Interrupt Pin (INTPIN):</b> Each AHB IP on Bridge is a single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	<b>Interrupt Line (INTLINE):</b> Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

## 16.9.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 80h

**Default:** 48030001h

31	28	24	20	16	12	8	4	0							
0	1	0	0	0	1	0	0	0							
0	0	0	0	0	0	0	0	1							
PMESUPPORT					Reserved0				VERSION		NXTCAP			POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	<b>PME_Support (PMESUPPORT):</b> This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	<b>Reserved0:</b> Reserved.
18:16	3h RO	<b>Version (VERSION):</b> Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	<b>Next Capability (NXTCAP):</b> Points to the next capability structure. This points to NULL.
7:0	01h RO	<b>Power Management Capability (POWER_CAP):</b> Indicates this is power management capability.

## 16.9.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 84h

**Default:** 00000008h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	1				
Reserved0				PMESTATUS		Reserved1		PMEENABLE	Reserved2	NO_SOFT_RESET	Reserved3	POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved0:</b> Reserved.
15	0h RW/1C	<b>PME Status (PMESTATUS):</b> 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	<b>Reserved1:</b> Reserved.
8	0h RW	<b>PME Enable (PMEENABLE):</b> A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	<b>Reserved2:</b> Reserved.
3	1h RO	<b>No Soft Reset (NO_SOFT_RESET):</b> This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	<b>Reserved3:</b> Reserved.
1:0	0h RW	<b>Power State (POWERSTATE):</b> This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

### 16.9.13 General Purpose Read Write Register1 (GEN\_REGRW1)—Offset A0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + A0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
GEN_REG_RW1											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GEN_REG_RW1:</b> capabilities over-ride for the sd/sdio/emmc host controller (bits 31:0)

## 16.9.14 General Purpose Read Write Register2 (GEN\_REGRW2)—Offset A4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + A4h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
CAP_REG_SEL								GEN_REG_RW2	

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>CAP_REG_SEL:</b> select if the capability will come from the GEN PCI register or from a hard wire
30:0	0h RW	<b>GEN_REG_RW2:</b> capabilities over-ride for the sd/sdio/emmc host controller (bits 62:32)

## 16.9.15 General Purpose Read Write Register3 (GEN\_REGRW3)—Offset A8h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + A8h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
								GEN_REG_RW3	

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GEN_REG_RW3:</b> Reserved.

## 16.9.16 General Purpose Read Write Register4 (GEN\_REGRW4)—Offset ACh

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + ACh

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

### 16.9.17 General Purpose Input Register (GEN\_INPUT\_REGRW)—Offset C0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + C0h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	GEN_REG_INPUT_RW: Reserved.

### 16.9.18 Manufacturers ID Register (MANID)—Offset F8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + F8h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Manufacturer ID (MANID):</b> This register is brought out as straps to the top level.

## 16.10 eMMC 4.5 Memory Mapped IO Registers

**Table 189. Summary of eMMC 4.5 Memory Mapped I/O Registers—BAR**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1884	00000000h
4–5h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1885	0000h
6–7h	2	"Block Count Register (BLK_COUNT)—Offset 6h" on page 1886	0000h
8–Bh	4	"Argument 1 Register (ARGUMENT)—Offset 8h" on page 1887	00000000h
C–Dh	2	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 1887	0000h
E–Fh	2	"Command Register (CMD)—Offset Eh" on page 1889	0000h
10–13h	4	"Response Register 0 (RESPONSE0)—Offset 10h" on page 1890	00000000h
14–17h	4	"Response Register 2 (RESPONSE2)—Offset 14h" on page 1891	00000000h
18–1Bh	4	"Response Register 4 (RESPONSE4)—Offset 18h" on page 1891	00000000h
1C–1Fh	4	"Response Register 6 (RESPONSE6)—Offset 1Ch" on page 1892	00000000h
20–23h	4	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 1892	00000000h
24–27h	4	"Present State Register (PRE_STATE)—Offset 24h" on page 1893	1FFF0000h
28–28h	1	"Host Control 1 Register (HOST_CTL)—Offset 28h" on page 1896	00h
29–29h	1	"Power Control Register (PWR_CTL)—Offset 29h" on page 1897	00h
2A–2Ah	1	"Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah" on page 1898	00h
2B–2Bh	1	"Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh" on page 1899	00h
2C–2Dh	2	"Clock Control Register (CLK_CTL)—Offset 2Ch" on page 1900	0000h
2E–2Eh	1	"Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh" on page 1902	00h
2F–2Fh	1	"Software Reset Register (SW_RST)—Offset 2Fh" on page 1903	00h
30–31h	2	"Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h" on page 1904	0000h
32–33h	2	"Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h" on page 1907	0000h
34–35h	2	"Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h" on page 1909	0000h
36–37h	2	"Error Interrupt Status Enable Register (ERR_INT_STAT_EN)—Offset 36h" on page 1911	0000h

### 16.10.1 SDMA System Address / Argument 2 Register (SYS\_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p><b>SDMA System Address (sys_adr): (1) SDMA System Address</b>            This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.            The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register.            The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register.            When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer.            When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. <b>(2)</b></p> <p><b>Argument 2</b>            This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.            If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

### 16.10.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>TX_BLK_SIZE_12 (tx_blk_size_12):</b> Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	<p><b>Host SDMA Buffer Boundary (boundary):</b> The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <ul style="list-style-type: none"> <li>• 000b = 4K bytes (Detects A11 carry out)</li> <li>• 001b = 8K bytes (Detects A12 carry out)</li> <li>• 010b = 16K Bytes (Detects A13 carry out)</li> <li>• 011b = 32K Bytes (Detects A14 carry out)</li> <li>• 100b = 64K bytes (Detects A15 carry out)</li> <li>• 101b = 128K Bytes (Detects A16 carry out)</li> <li>• 110b = 256K Bytes (Detects A17 carry out)</li> <li>• 111b = 512K Bytes (Detects A18 carry out)</li> </ul>
11:0	000h RW	<p><b>Transfer Block Size (tr_blk_size):</b> This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 <i>Determining Buffer Block Length</i>). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <ul style="list-style-type: none"> <li>• 0800h = 2048 Bytes</li> <li>• . . .</li> <li>• 0200h = 512 Bytes</li> <li>• 01FFh = 511 Bytes</li> <li>• . . .</li> <li>• 0004h = 4 Bytes</li> <li>• 0003h = 3 Bytes</li> <li>• 0002h = 2 Bytes</li> <li>• 0001h = 1 Byte</li> <li>• 0000h = No data transfer</li> </ul>

### 16.10.3 Block Count Register (BLK\_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 6h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
blk_count				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<p><b>Blocks Count For Current Transfer (blk_count):</b> This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count.</p> <ul style="list-style-type: none"> <li>• 0000h = Stop Count</li> <li>• 0001h = 1 block</li> <li>• 0002h = 2 blocks</li> <li>• ...</li> <li>• FFFFh = 65535 blocks</li> </ul>

#### 16.10.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	<b>Command Argument 1 (argument):</b> The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

#### 16.10.5 Transfer Mode Register (TX\_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

15	12	8	4	0

15:9	00h RO	<b>Reserved (rsvd):</b> Reserved.
8	0b RW	<b>BOOT_EN (boot_en):</b> To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	<b>SPI_MODE (spi_mode):</b> SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	<b>CMD_COMP_ATA (cmd_comp_ata):</b> Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	<b>BLK_SEL (blk_sel):</b> Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	<b>Data Transfer Direction Select (data_tr_dir):</b> This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. <ul style="list-style-type: none"> <li>1 = Read (Card to Host)</li> <li>0 = Write (Host to Card)</li> </ul>
3:2	0b RW	<b>AUTO_CMD_EN (auto_cmd_en):</b> This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	<b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
0	0b RW	<b>DMA Enable (dma_en):</b> This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> <li>1 = DMA Data transfer</li> <li>0 = No data transfer or Non DMA data transfer</li> </ul>

## 16.10.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
rsvd	cmd_index	cmd_type	data_pr_sel cmd_index_chk_en cmd_crc_chk_en	reserved resp_type_sel

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	<b>Rsvd (rsvd):</b> Reserved.
13:8	0h RW	<b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	<p><b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. <b>(1) Suspend Command</b> If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). <b>(2) Resume Command</b> The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. <b>(3) Abort Command</b> If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction).</p> <ul style="list-style-type: none"> <li>11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR</li> <li>10b = Resume -- CMD52 for writing 'Function Select' in CCCR</li> <li>01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR</li> <li>00b = Normal -- Other commands</li> </ul>
5	0b RW	<p><b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command.</p> <ul style="list-style-type: none"> <li>1 = Data Present</li> <li>0 = No Data Present</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	<b>Command Index Check Enable (cmd_index_chk_en):</b> If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
3	0b RW	<b>Command CRC Check Enable (cmd_crc_chk_en):</b> If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>

19	1b RO	<b>Write Protect Switch Pin Level (wr_prot_sw_pin_lvl):</b> The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP# pin. <ul style="list-style-type: none"> <li>1 = Write enabled (SDWP#=1)</li> <li>0 = Write protected (SDWP#=0)</li> </ul>
18	1b RO	<b>Card Detect Pin Level (crd_det_pin_lvl):</b> This bit reflects the inverse value of the SD CD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. <ul style="list-style-type: none"> <li>1 = Card present (SD CD#=0)</li> <li>0 = No card present (SD CD#=1)</li> </ul>
17	1b RO	<b>Card State Stable (crd_st_stable):</b> This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. No Card state can be detected by this bit being set to 1 while Card Inserted is set to 0. The Software Reset For All in the Software Reset register shall not affect this bit. <ul style="list-style-type: none"> <li>1 = No Card or Inserted</li> <li>0 = Reset or Debouncing</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	<p><b>Card Inserted (crd_ins):</b> This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = Reset or Debouncing or No Card</li> </ul>
15:12	0h RO	<p><b>Reserved1 (reserved1):</b> Reserved.</p>
11	0b RO	<p><b>Buffer Read Enable (buf_rd_en):</b> This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt.</p> <ul style="list-style-type: none"> <li>1 = Read enable</li> <li>0 = Read disable</li> </ul>
10	0b RO	<p><b>Buffer Write Enable (buf_wr_en):</b> This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register.</p> <ul style="list-style-type: none"> <li>1 = Write enable</li> <li>0 = Write disable</li> </ul>
9	0b RO	<p><b>Read Transfer Active (rd_tx_active):</b> This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions:</p> <ul style="list-style-type: none"> <li>After the end bit of the read command.</li> <li>When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared to 0 for either of the following conditions:</p> <ul style="list-style-type: none"> <li>When the last data block as specified by block length is transferred to the System.</li> <li>In case of ADMA2, end of read operation is designated by Descriptor Table.</li> <li>When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1.</li> </ul> <p>A Transfer Complete interrupt is generated when this bit changes to 0.</p> <ul style="list-style-type: none"> <li>1 = Transferring data</li> <li>0 = No valid data</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p><b>Write Transfer Active (wr_tx_active):</b> This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the write command.</li> <li>• When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table.</li> <li>• After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request.</li> </ul> <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <ul style="list-style-type: none"> <li>• 1 Transferring data</li> <li>• 0 No valid data</li> </ul>
7:3	00h RO	<p><b>Reserved (reserved):</b> Reserved.</p>
2	0b RO	<p><b>DAT Line Active (dat_in_active):</b> This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the read command.</li> <li>• When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>• When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request.</li> </ul> <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>• After the end bit of the write command.</li> <li>• When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>• When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>• When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</li> </ul> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> <li>• 1 = DAT Line Active</li> <li>• 0 = DAT Line Inactive</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<p><b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. <b>Note:</b> The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <ul style="list-style-type: none"> <li>1 Cannot issue command which uses the DAT line</li> <li>0 Can issue command which uses the DAT line</li> </ul>
0	0b RO	<p><b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set.</p> <ul style="list-style-type: none"> <li>1 Cannot issue command</li> <li>0 Can issue command using only CMD line</li> </ul>

### 16.10.13 Host Control 1 Register (HOST\_CTL)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00h

7	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lv	sd8_bit_mode	dma_sel	hi_spd_en	data_tx_wid	led_ctl	

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	<p><b>Card Detect Signal Selection (crd_det_sig_sel):</b> This bit selects source for the card detection.</p> <ul style="list-style-type: none"> <li>1 = The Card Detect Test Level is selected (for test purposes)</li> <li>0 = SDCD# is selected (for normal use)</li> </ul> <p>When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during the period of debouncing.</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<b>Card Detect Test Level (crd_det_tst_lvl):</b> This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = No Card</li> </ul>
5	0b RW	<b>SD8 Bit Mode (sd8_bit_mode):</b> This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	<b>DMA Select (dma_sel):</b> One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. <ul style="list-style-type: none"> <li>00 = SDMA is selected</li> <li>01 = Reserved (New assignment is not allowed)</li> <li>10 = 32-bit Address ADMA2 is selected</li> <li>11 = Reserved (will be modified by Version 4.00)</li> </ul>
2	0b RW	<b>High Speed Enable (hi_spd_en):</b> This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. <ul style="list-style-type: none"> <li>1 = 4-bit mode</li> <li>0 = 1-bit mode</li> </ul>
1	0b RW	<b>Data Transfer Width (data_tx_wid):</b> Reserved.
0	0b RW	<b>LED Control (led_ctl):</b> This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. <ul style="list-style-type: none"> <li>1 = 4-bit mode</li> <li>0 = 1-bit mode</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	<b>Reserved (rsvd):</b> Reserved.
4	0b RW	<b>DRIVE_CCSD (drive_ccsd):</b> If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<p><b>Interrupt at Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.</p> <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>
2	0b RW	<p><b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.</p> <ul style="list-style-type: none"> <li>1 = Enable Read Wait Control</li> <li>0 = Disable Read Wait Control</li> </ul>
1	0b RW	<p><b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <ul style="list-style-type: none"> <li>In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts.</li> <li>In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts.</li> </ul> <p>Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored.</p> <ul style="list-style-type: none"> <li>1 = Restart</li> <li>0 = Not affect</li> </ul>
0	0b RW	<p><b>Stop at Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12.</p> <ul style="list-style-type: none"> <li>1 = Stop</li> <li>0 = Transfer</li> </ul>

### 16.10.16 Wakeup Control Register (WAKEUP\_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

#### Access Method

0	0	0	0	0
sdclk_freq_sel		upper_sdclk_freq_sel	rsvd	sd_clk_en int_clk_stable int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	<p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. <b>(1) 8-bit Divided Clock Mode</b> This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. <b>(1) 8-bit Divided Clock Mode</b></p> <ul style="list-style-type: none"> <li>• 80h = base clock divided by 256</li> <li>• 40h = base clock divided by 128</li> <li>• 20h = base clock divided by 64</li> <li>• 10h = base clock divided by 32</li> <li>• 08h = base clock divided by 16</li> <li>• 04h = base clock divided by 8</li> <li>• 02h = base clock divided by 4</li> <li>• 01h = base clock divided by 2</li> <li>• 00h = base clock(10MHz and up)</li> </ul> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>• 400KHz divider value</li> <li>• 25MHz divider value</li> <li>• 50MHz divider value</li> </ul> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p><b>(2) 10-bit Divided Clock Mode</b> Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> <li>• 3FFh = 1/2046 Divided Clock</li> <li>• N = 1/2N Divided Clock (Duty 50%)</li> <li>• 002h = 1/4 Divided Clock</li> <li>• 001h = 1/2 Divided Clock</li> <li>• 000h = Base Clock (10MHz and up)</li> <li>• 3FFh = Base Clock * M / 1024</li> <li>• .....</li> <li>• N - 1 = Base Clock * M / N</li> <li>• .....</li> <li>• 002h = Base Clock * M / 3</li> <li>• 001h = Base Clock * M / 2</li> <li>• 000h = Base Clock * M</li> </ul> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	<b>Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel):</b> Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	<b>Rsvd (rsvd):</b> Reserved.
2	0b RW	<b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>
1	0b RO	<b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. <b>Note:</b> This is useful when using PLL for a clock oscillator that requires setup time. <ul style="list-style-type: none"> <li>1 = Ready</li> <li>0 = Not Ready</li> </ul>
0	0b RW	<b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. <ul style="list-style-type: none"> <li>1 = Oscillate</li> <li>0 = Stop</li> </ul>

### 16.10.18 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

0	0b RW	<p><b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> <li>• 1 = Reset</li> <li>• 0 = Work</li> </ul> <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>

### 16.10.20 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

12	0b RO	<b>Re-Tuning Event (re_tune):</b> This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. <ul style="list-style-type: none"> <li>1 Re-Tuning should be performed</li> <li>0 Re-Tuning is not required</li> </ul>
11	0b RO	<b>INT_C (int_c):</b> This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_C is detected</li> <li>0 = No interrupt is detected</li> </ul>
10	0b RO	<b>INT_B (int_b):</b> This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_B is detected</li> <li>0 = No interrupt is detected</li> </ul>
9	0b RO	<b>INT_A (int_a):</b> This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> <li>1 = INT_A is detected</li> <li>0 = No interrupt is detected</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p><b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> <li>1 = Generate Card Interrupt</li> <li>0 = No Card Interrupt</li> </ul>
7	0b RW/1C	<p><b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>1 = Card removed</li> <li>0 = Card state stable or Debouncing</li> </ul>
6	0b RW/1C	<p><b>Card Insertion (crd_ins):</b> This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>1 Card inserted</li> <li>0 Card state stable or Debouncing</li> </ul>
5	0b RW/1C	<p><b>Buffer Read Ready (buf_rd_rdy):</b> This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution.</p> <ul style="list-style-type: none"> <li>1 = Ready to read buffer</li> <li>0 = Not ready to read buffer</li> </ul>
4	0b RW/1C	<p><b>Buffer Write Ready (buf_wr_rdy):</b> This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register.</p> <ul style="list-style-type: none"> <li>1 = Ready to write buffer</li> <li>0 = Not ready to write buffer</li> </ul>
3	0b RW/1C	<p><b>DMA Interrupt (dma_int):</b> This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete.</p> <ul style="list-style-type: none"> <li>1 = DMA Interrupt is generated</li> <li>0 = No DMA Interrupt</li> </ul>
2	0b RW/1C	<p><b>Block Gap Event (blk_gap_event):</b> If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p1<b>(1)</b> <b>In the case of a Write Transaction</b> This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> <li>1 = Transaction stopped at block gap</li> <li>0 = No Block Gap Event</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	<p><b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. <b>(2) In the case of a Write Transaction</b> This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. <b>(3) In the case of a command with busy</b> This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> <li>• 1 = Command execution is completed</li> <li>• 0 = Not complete</li> </ul> <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p>
0	0b RW/1C	<p><b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> <li>• 1 = Command complete</li> <li>• 0 = No command complete</li> </ul>

### 16.10.21 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 32h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>Vendor Specific Error Status (vend_spec_err_status):</b> Reserved.
14	0b RW	<b>Boot Command Timeout Error (boot_cmd_timeout_err):</b> Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	<b>CEATA Error (ceata_err):</b> Occurs when ATA command termination has occurred due to an error condition the device has encountered.
12	0b RW	<b>Target Response Error (tgt_rsp_err):</b> Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	<b>Reserved (rsvd):</b> Reserved.
9	0b RW	<b>ADMA Error (adma_err):</b> This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. <b>ADMA Error State</b> in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. <ul style="list-style-type: none"> <li>0 = error</li> <li>1 = no error</li> </ul>
8	0b RW	<b>Auto CMD12 Error (cmd12_err):</b> Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
7	0b RW	<b>Current Limit Error (cur_limit_err):</b> By setting the <b>SD Bus Power</b> bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. <ul style="list-style-type: none"> <li>1 = power fail</li> <li>0 = no error</li> </ul>
6	0b RW	<b>Data End Bit Error (data_end_bit_err):</b> Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
5	0b RW	<b>Data CRC Error (data_crc_err):</b> Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	<b>Data Timeout Error (data_timeout_err):</b> This bit is set when detecting one of following timeout conditions. <ul style="list-style-type: none"> <li>Busy timeout for R1b,R5b type</li> <li>Busy timeout after Write CRC status</li> <li>Write CRC Status timeout</li> <li>Read Data timeout</li> </ul> <ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no error</li> </ul>

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<b>Command Index Error (cmd_index_err):</b> This bit is set if a Command Index error occurs in the command response. <ul style="list-style-type: none"> <li>1 = error</li> <li>0 = no error</li> </ul>
2	0b RW	<b>Command End Bit Error (cmd_end_bit_err):</b> This bit is set when detecting that the end bit of a command response is 0. <ul style="list-style-type: none"> <li>1 = End Bit Error generated</li> <li>0 = no error</li> </ul>
1	0b RW	<b>Command CRC Error (cmd_crc_err): Command CRC Error</b> is generated in two cases. If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between <b>Command CRC Error</b> and <b>Command Timeout Error</b> ). <ul style="list-style-type: none"> <li>1 = CRC Error Generated.</li> <li>0 = no error</li> </ul>
0	0b RW	<b>Command Timeout Error (cmd_timeout_err):</b> This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case <b>Command CRC Error</b> shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and <b>Command CRC Error</b> ) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. <ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no Error</li> </ul>

### 16.10.22 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

#### Access Method

## 16.10.26 Auto CMD12 Error Status Register and Host Control 2 Register (CMD12\_ERR\_STAT\_HOST\_CTRL\_2)—Offset 3Ch

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

31		28				24				20				16				12				8				4				0			
0		0				0				0				0				0				0				0				0			
preset_value	async_int	RSVD0				sampling_clock	execute_tuning	driver_strength	vi	uhs_mode	rsvd				cmd_not_iss_cmd12_err	rsvd1	cmd12_ind_err	cmd12_end_bit_err	cmd12_crc_err	cmd12_timeout_err	cmd12_not_exe												

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Preset Value (preset_value):</b> Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. <ul style="list-style-type: none"> <li>1 = Automatic Selection by Preset Value are Enabled</li> <li>0 SDCLK and Driver Strength are controlled by Host Driver</li> </ul> If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	<b>Asynchronous Interrupt (async_int):</b> This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this bit to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete. <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>

### 16.10.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

**Note:** By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 52h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

### 16.10.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.

- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 54h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	<b>RSVD0:</b> Reserved
30:24	0h RW	<b>Back-End Power Control (pwr_ctrl):</b> Each bit of this field controls back-end power supply for an embedded device. Host interface voltage (VDDH) is not controlled by this field. The number of devices supported is specified by <b>Number of Clock Pins</b> , and a maximum of 7 devices can be controlled. <ul style="list-style-type: none"> <li>• D24 Back-end Power Control for Device 1</li> <li>• D25 Back-end Power Control for Device 2</li> <li>• D26 Back-end Power Control for Device 3</li> <li>• D27 Back-end Power Control for Device 4</li> <li>• D28 Back-end Power Control for Device 5</li> <li>• D29 Back-end Power Control for Device 6</li> <li>• D30 Back-end Power Control for Device 7</li> </ul> The function of each bit is defined as follows: <ul style="list-style-type: none"> <li>• 0 = Back-end Power is Off</li> <li>• 1 = Back-end Power is Supplied</li> </ul> Back-End power control is effective for embedded memory devices in the Sleep State that support the Sleep command (CMD14) to reduce power consumption and embedded SDIO devices when IOEx is set to 0.
23	0b RO	<b>RSVD1:</b> Reserved

Bit Range	Default & Access	Field Name (ID): Description
22:20	0h RW	<p><b>Interrupt Pin Select (int_pin):</b> Interrupt pin inputs are enabled by this field. Enable of unsupported interrupt pin is meaningless.</p> <ul style="list-style-type: none"> <li>• 000b = Interrupt is detected by the Interrupt Cycle.</li> <li>• xx1b = INT_A is enabled</li> <li>• x1xb = INT_B is enabled</li> <li>• 1xxb = INT_C is enabled</li> </ul>
19	0b RO	<b>RSVD2:</b> Reserved
18:16	0h RW	<p><b>Clock Pin Select (clk_pin):</b> One of clock pin outputs is selected by this field. Selection of unsupported clock pins is meaningless. Refer to Figure 2-38 for the timing of clock outputs.</p> <ul style="list-style-type: none"> <li>• 000b = Clock Pins are disabled</li> <li>• 001b = CLK[1] is selected</li> <li>• 010b = CLK[2] is selected</li> <li>• ...</li> <li>• 111b = CLK[7] is Selected</li> </ul>
15	0b RO	<b>RSVD3:</b> Reserved
14:8	0h RO	<p><b>Bus Width Preset (bus_width):</b> Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins, and a maximum of 7 devices are supported. This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1.</p> <ul style="list-style-type: none"> <li>• D24 = Bus width preset for Device 1</li> <li>• D25 = Bus width preset for Device 2</li> <li>• D26 = Bus width preset for Device 3</li> <li>• D27 = Bus width preset for Device 4</li> <li>• D28 = Bus width preset for Device 5</li> <li>• D29 = Bus width preset for Device 6</li> <li>• D30 = Bus width preset for Device 7</li> </ul> <p>The function of each bit is defined as follows:</p> <ul style="list-style-type: none"> <li>• 0 = 4 bit buswidth mode</li> <li>• 1 = 8 bit buswidth mode</li> </ul>
7:6	0b RO	<b>RSVD4:</b> Reserved
5:4	0h RO	<p><b>Number of Interrupt Pins (num_int_pin):</b> This field indicates support of interrupt input pins for shared bus system. Three asynchronous interrupt pins are defined, INT_A#, INT_B# and INT_C#. Which interrupt pin is used is determined by the system. Each one is driven by open drain and then wired OR connection is possible.</p> <ul style="list-style-type: none"> <li>• 00b = Interrupt Input Pin is not supported</li> <li>• 01b = INTA is Supported</li> <li>• 10b = INTA and INTB are supported</li> <li>• 11b = INTA, INTB and INTC are supported</li> </ul>
3	0b RO	<b>RSVD5:</b> Reserved
2:0	0h RO	<p><b>Number of Clock Pins (num_clk_pin):</b> This field indicates support of clock pins to select one of devices for shared bus system. Up to 7 clock pins can be supported. Shared bus is supported by specific system. Then the Standard Host Driver does not support control of these clock pins.</p> <ul style="list-style-type: none"> <li>• 000b Shared bus is not supported</li> <li>• 001b 1 SDCLK pin is supported</li> <li>• 010b 2 SDCLK pins are supported</li> <li>• ...</li> <li>• 111b 7 SDCLK pins are supported</li> </ul>

### 16.10.37 SPI Interrupt Support Register (SPI\_INT\_SUP)—Offset F0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + F0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	<b>SPI Interrupt Support (spi_int_support):</b> This bit is set to indicate the assertion of interrupts in the SPI mode at any time, irrespective of the status of the card select (CS) line. If this bit is zero, then SDIO card can only assert the interrupt line in the SPI mode when the CS line is asserted.

### 16.10.38 Slot Interrupt Status Register (SLOT\_INT\_STAT)—Offset FCh

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + FCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RO	<b>Reserved (reserved):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	<p><b>Interrupt Signal For Each Slot (int_sig_slot):</b> These status bits indicate the logical OR of Interrupt Signal and Wakeup Signal for each slot. A maximum of 8 slots can be defined. If one interrupt signal is associated with multiple slots, the Host Driver can know which interrupt is generated by reading these status bits. By a power on reset or by setting Software Reset For All, the interrupt signal shall be de-asserted and this status shall read 00h.</p> <ul style="list-style-type: none"> <li>• Bit 00 = Slot 1</li> <li>• Bit 01 = Slot 2</li> <li>• Bit 02 = Slot 3</li> <li>• ..... ..</li> <li>• Bit 07 = Slot 8</li> </ul>

### 16.10.39 Host Controller Version Register (HOST\_CTRL\_VER)—Offset FEh

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + FEh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** B502h

15	12	8	4	0

1	0	1	0	1	
0	1	0	1	0	
0	0	0	0	0	
0	0	1	0	0	
vend_ver_num				spec_ver_num	

Bit Range	Default & Access	Field Name (ID): Description
15:8	b5h RO	<b>Vendor Version Number (vend_ver_num):</b> This status is reserved for the vendor version number. The Host Driver should not use this status.
7:0	02h RO	<p><b>Specification Version Number (spec_ver_num):</b> This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version.</p> <ul style="list-style-type: none"> <li>• 00h = SD Host Specification Version 1.00</li> <li>• 01h = SD Host Specification Version 2.00, Including the feature of the ADMA and Test Register</li> <li>• 02h = SD Host Specification Version 3.00</li> <li>• others = Reserved</li> </ul>

## 17 Serial ATA (SATA)

The SoC has one integrated SATA host controller that supports independent DMA operation on up to 2 ports and supports data transfer rates of 1.5 Gb/s (150 MB/s) and 3.0 Gb/s (300 MB/s). The SATA controller contains two modes of operation—a legacy mode using I/O space, and an AHCI mode using memory space. Software that uses legacy mode will not have AHCI capabilities.

The SoC supports the Serial ATA Specification, Revision 2.6. The SoC also supports several optional sections of the SATA Revision 2.0 Specifications: Extensions to Serial ATA 1.0 Specification, Revision 1.0 (AHCI support is required for some elements).

The SATA controllers feature two sets of interface signals (ports) that can be independently enabled or disabled (they cannot be tri-stated or driven low). Each interface is supported by an independent DMA controller.

The SATA controllers interact with an attached mass storage device through a register interface that is equivalent to that presented by a traditional IDE host adapter. The host software follows existing standards and conventions when accessing the register interface and follows standard command protocol conventions.

**Note 1.** SATA DevSlp (**Device Sleep**) is not part of revision 2.6 of the SATA specification, with which this processor is compliant. As such, any DEVSLP functionality of this processor is not specification compliant and should not be used.

**Note 2.** SATA interface transfer rates are independent of UDMA mode settings. SATA interface transfer rates will operate at the bus's maximum speed, regardless of the UDMA mode reported by the SATA device or the system BIOS.

### 17.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Table 190. Signals**

Signal Name	Direction Plat. Power	Description
SATA_GP[0]	I V1P8S	<b>Serial ATA 0 General Purpose:</b> This is an input pin which can be configured as an interlock switch or as a general purpose I/O, depending on the platform. When used as an interlock switch status indication, this signal should be driven to '0' to indicate that the switch is closed, and to '1' to indicate that the switch is open.
SATA_GP[1]	I V1P8S	<b>Serial ATA 1 General Purpose:</b> Same as above.
SATA_LED#	O V1P8S	<b>Serial ATA LED:</b> This is an open-collector output pin driven during SATA command activity. It is to be connected to external circuitry that can provide the current to drive a platform LED. When active, the LED is on. When tristated, the LED is off.
SATA_TXP[1:0] SATA_TXN[1:0]	O VPCIESATA	<b>Serial ATA Port 1 and 0:</b> These are outbound high-speed differential signals to Port 1 and 0.
SATA_RXP[1:0] SATA_RXN[1:0]	I VPCIESATA	<b>Serial ATA Port 1 and 0:</b> These are inbound high-speed differential signals to Port 1 and 0.
SATA_RCOMP_P SATA_RCOMP_N	O	These pins are used to connect the external resistors used for Rcomp. Please contact your Intel representative for details.

## 17.2 Features

### 17.2.1 Supported Features

**Table 191. SATA Feature List (Sheet 1 of 2)**

Feature	Description
Native Command Queuing (NCQ)	Allows the device to reorder commands for more efficient data transfers
Auto Activate for DMA	Collapses a DMA Setup then DMA Activate sequence into a DMA Setup only
Hot Plug Support	Allows for device detection without power being applied and ability to connect and disconnect devices without prior notification to the system
Asynchronous Signal Recovery	Provides a recovery from a loss of signal or establishing communication after hot plug
3 Gb/s Transfer Rate	Capable of data transfers up to 3 Gb/s
ATAPI Asynchronous Notification	A mechanism for a device to send a notification to the host that the device requires attention

**Table 191. SATA Feature List (Sheet 2 of 2)**

Feature	Description
Host & Link Initiated Power Management	Capability for the host controller or device to request Partial and Slumber interface power states
Staggered Spin-Up	Enables the host to spin up hard drives sequentially to prevent power load problems on boot
Command Completion Coalescing	Reduces interrupt and completion overhead by allowing a specified number of commands to complete and then generating an interrupt to process the commands

**Table 192. SATA/AHCI Feature Matrix**

Feature	AHCI Disabled	AHCI Enabled
Native Command Queuing (NCQ)	N/A	Supported
Auto Activate for DMA	N/A	Supported
Hot Plug Support	N/A	Supported
Asynchronous Signal Recovery	N/A	Supported
3 Gb/s Transfer Rate	Supported	Supported
ATAPI Asynchronous Notification	N/A	Supported
Host & Link Initiated Power Management	N/A	Supported
Staggered Spin-Up	Supported	Supported
Command Completion Coalescing	N/A	N/A

## 17.2.2 Theory of Operation

### 17.2.2.1 Standard ATA Emulation

The SoC contains a set of registers that shadow the contents of the legacy IDE registers. The behavior of the Command and Control Block registers, PIO, and DMA data transfers, resets, and interrupts are all emulated.

**Note:** The SoC will assert INTR when the master device completes the EDD command regardless of the command completion status of the slave device. If the master completes EDD first, an INTR is generated and BSY will remain '1' until the slave completes the command. If the slave completes EDD first, BSY will be '0' when the master completes the EDD command and asserts INTR. Software must wait for busy to clear (0) before completing an EDD command, as required by the ATA5 through ATA7 (T13) industry standards.

### 17.2.2.2 48-Bit LBA Operation

The SATA host controller supports 48-bit LBA through the host-to-device register FIS when accesses are performed using writes to the task file. The SATA host controller will ensure that the correct data is put into the correct byte of the host-to-device FIS.

There are special considerations when reading from the task file to support 48-bit LBA operation. Software may need to read all 16-bits. Since the registers are only 8-bits wide and act as a FIFO, a bit must be set in the device/control register, which is at offset 3F6h for primary and 376h for secondary (or their native counterparts).

If software clears Bit 7 of the control register before performing a read, the last item written will be returned from the FIFO. If software sets Bit 7 of the control register before performing a read, the first item written will be returned from the FIFO.

### 17.2.3 AHCI Operation

The SoC provides hardware support for Advanced Host Controller Interface (AHCI), a programming interface for SATA host controllers developed through a joint industry effort. AHCI defines transactions between the SATA controller and software and enables advanced performance and usability with SATA. Platforms supporting AHCI may take advantage of performance features such as no master/slave designation for SATA devices—each device is treated as a master—and hardware assisted native command queuing. AHCI also provides usability enhancements such as Hot-Plug. AHCI requires appropriate software support (such as, an AHCI driver) and for some features, hardware support in the SATA device or additional platform hardware.

The SoC supports all of the mandatory features of the *Serial ATA Advanced Host Controller Interface Specification*, Revision 1.3 and many optional features, such as hardware assisted native command queuing, aggressive power management, LED indicator support, and Hot-Plug through the use of interlock switch support (additional platform hardware and software may be required depending upon the implementation).

**Note:** For reliable device removal notification while in AHCI operation without the use of interlock switches (surprise removal), interface power management should be disabled for the associated port.

### 17.5.1 Identifiers (ID)—Offset 0h

#### Access Method

**Type:** PCI Configuration Register (Size: 32 bits) **ID:** [B:0, D:19, F:0] + 0h

**Default:** 0F208086h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	1	1	1	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DID				VID				

Bit Range	Default & Access	Description
31:16	0F20h RO	<b>Device ID (DID):</b> The specific value is dependent on config bits and fuses. The value is product specific. VLV SATA DID can be within the range of 0F20-0F27 and 0F2E and 0F2F. However, since VLV SATA does not support RAID, DID can be either 0F20 or 0F22.
15:0	8086h RO	<b>Vendor ID (VID):</b> 16-bit field which indicates the company vendor as Intel.

### 17.5.2 Command (CMD)—Offset 4h

#### Access Method

**Type:** PCI Configuration Register (Size: 16 bits) **CMD:** [B:0, D:19, F:0] + 4h

**Default:** 0000h

15	12	8	4	0										
0	0	0	0	0										
RSVD0				ID	FBE	SEE	WCC	PEE	VGA	MWIE	SCE	BME	MSE	IOSE

Bit Range	Default & Access	Description
15:11	0b RO	<b>RSVD0:</b> Reserved
10	0h RW	<b>Interrupt Disable (ID):</b> This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# is generated if there is an interrupt and MSI is not enabled.
9	0h RO	<b>Fast Back-to-Back Enable (FBE):</b> Reserved.
8	0h RW	<b>SERR# Enable (SEE):</b> When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	<b>Wait Cycle Enable (WCC):</b> Reserved.
6	0h RW	<b>Parity Error Response Enable (PEE):</b> When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0h RO	<b>VGA Palette Snooping Enable (VGA):</b> Reserved.
4	0h RO	<b>Memory Write and Invalidate Enable (MWIE):</b> Reserved.
3	0h RO	<b>Special Cycle Enable (SCE):</b> Reserved.
2	0h RW	<b>Bus Master Enable (BME):</b> Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	<b>Memory Space Enable (MSE):</b> Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	<b>I/O Space Enable (IOSE):</b> Controls access to the SATA Controller's target I/O space.

### 17.5.3 Device Status (STS)—Offset 6h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**STS:** [B:0, D:19, F:0] + 6h

**Default:** 02B0h

15	12	8	4	0								
0	0	0	0	0								
DPE	SSE	RMA	RTA	STA	DEVT	DPD	FBC	RSVD0	RSV	CL	IS	RSVD1

Bit Range	Default & Access	Description
15	0h RW/1C	<b>Detected Parity Error (DPE):</b> Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C	<b>Signaled System Error (SSE):</b> Set when SATA Controller generates an SERR#.
13	0h RW/1C	<b>Received Master-Abort Status (RMA):</b> Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C	<b>Received Target-Abort Status (RTA):</b> Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C	<b>Signaled Target-Abort Status (STA):</b> This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	<b>DEVSEL# Timing Status (DEVT):</b> Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C	<b>Master Data Parity Error Detected (DPD):</b> Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	1h RO	<b>Fast Back-to-Back Capable (FBC):</b> Reserved.
6	0b RO	<b>RSVD0:</b> Reserved
5	1h RO	<b>66 MHz Capable (RSV):</b> Reserved.
4	1h RO	<b>Capabilities List (CL):</b> Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO	<b>Interrupt Status (IS):</b> Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0b RO	<b>RSVD1:</b> Reserved

## 17.5.4 Revision ID (RID)—Offset 8h

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**RID:** [B:0, D:19, F:0] + 8h

**Default:** 00h

7	4	0
0	0	0
RID		

Bit Range	Default & Access	Description
7:0	00h RO	<b>Revision ID (RID):</b> Indicates stepping of the host controller hardware.

## 17.5.5 Programming Interface (PI)—Offset 9h

This register definition depends on the CC.SCC field. When the CC.SCC is 01h(IDE mode), register definition corresponds to 1st table. When CC.SCC is 06h(AHCI mode), register definition follows the 2nd table.

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**PI:** [B:0, D:19, F:0] + 9h

**Default:** 8Ah

7			4				0
1	0	0	0	1	0	1	0
BMS	RSVD0			SNC	SNE	PNC	PNE

Bit Range	Default & Access	Description
7	1h RO	<b>Bus Master Support (BMS):</b> Indicates the SATA Controller supports bus master operation.
6:4	0b RO	<b>RSVD0:</b> Reserved
3	1h RO	<b>Secondary Mode Native Capable (SNC):</b> Indicates that the secondary controller supports both legacy and native modes.
2	0h RW	<b>Secondary Mode Native Enable (SNE):</b> Determines the mode that the secondary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the PNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.
1	1h RO	<b>Primary Mode Native Capable (PNC):</b> Indicates that the primary controller supports both legacy and native modes.
0	0h RW	<b>Primary Mode Native Enable (PNE):</b> Determines the mode that the primary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the SNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.

## 17.5.6 Class Code (CC)—Offset Ah

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**CC:** [B:0, D:19, F:0] + Ah

**Default:** 0106h

15		12		8		4		0
0	0	0	0	0	0	0	1	0
BCC				SCC				

Bit Range	Default & Access	Description
15:8	01h RO	<b>Base Class Code (BCC):</b> Indicates that this is a mass storage device.
7:0	06h RO	<b>Sub Class Code (SCC):</b> The value reported in this field is dependent on MAP.SMS and various fuses and configuration bits. The value is product specific. For VLV this field may read 01h (IDE) or 06h (AHCI).

### 17.5.7 Cache Line Size (CLS)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CLS:** [B:0, D:19, F:0] + Ch

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RO	<b>Cache Line Size (CLS):</b> This register has no meaning for the SATA controller.

### 17.5.8 Master Latency Timer (MLT)—Offset Dh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**MLT:** [B:0, D:19, F:0] + Dh

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RO	<b>Master Latency Timer (MLT):</b> This register has no meaning for the SATA controller.

### 17.5.9 Header Type (HTYPE)—Offset Eh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HTYPE:** [B:0, D:19, F:0] + Eh

**Default:** 00h

7		4		0
0	0	0	0	0
MFD	HL			

Bit Range	Default & Access	Description
7	0h RO	<b>Multi-function Device (MFD):</b> Indicates this controller is not part of a multi-function device.
6:0	00h RO	<b>Header Layout (HL):</b> Indicates that the controller uses a target device layout.

### 17.5.10 Primary Command Block Base Address (PCMDBA)—Offset 10h

This 8-byte I/O space is used in Native Mode for the Primary Controller's Command Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCMDBA:** [B:0, D:19, F:0] + 10h

**Default:** 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BAR				RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:3	0h RW	<b>Base Address (BAR):</b> Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	<b>RSVD1:</b> Reserved
0	1h RO	<b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.

### 17.5.11 Primary Control Block Base Address (PCTLBA)—Offset 14h

This 4-byte I/O space is used in Native Mode for the Primary Controller's Control Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCTLBA:** [B:0, D:19, F:0] + 14h

**Default:** 00000001h

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:2	0h RW	<b>Base Address (BAR):</b> Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	<b>RSVD1:</b> Reserved
0	1h RO	<b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.

### 17.5.12 Secondary Command Block Base Address (SCMDBA)—Offset 18h

This 8-byte I/O space is used in Native Mode for the Secondary Controller's Command Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SCMDBA:** [B:0, D:19, F:0] + 18h

**Default:** 00000001h

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:3	0h RW	<b>Base Address (BAR):</b> Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	<b>RSVD1:</b> Reserved
0	1h RO	<b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.

### 17.5.13 Secondary Control Block Base Address (SCTLBA)—Offset 1Ch

This 4-byte I/O space is used in Native Mode for the Secondary Controller's Control Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SCTLBA:** [B:0, D:19, F:0] + 1Ch

**Default:** 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BAR				RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:2	0h RW	<b>Base Address (BAR):</b> Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	<b>RSVD1:</b> Reserved
0	1h RO	<b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.

### 17.5.14 Legacy IDE Base Address / AHCI Index Data Pair Base Address (LBAR)—Offset 20h

This BAR is used to allocate I/O space for the SFF-8038i mode of operation (aka Bus Master IDE) and if CC.SCC is not 01h, it is used to allocate I/O space for the AHCI index/data pair mechanism as well. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**LBAR:** [B:0, D:19, F:0] + 20h

**Default:** 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BA				RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved

Bit Range	Default & Access	Description
15:4	0h RW	<b>Base Address (BA):</b> Base address of the I/O space. Note for Base Address bit 4: When CC.SCC is 01h, this bit will be RW resulting in requesting 16B of I/O space. When CC.SCC is not 01h, this bit will be RO=0 resulting in requesting 32B of I/O space.
3:1	0b RO	<b>RSVD1:</b> Reserved
0	1h RO	<b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.

### 17.5.15 AHCI Base Address/Serial ATA Index Data Pair Base Address (ABAR)—Offset 24h

When the programming interface is not IDE (i.e. CC.SCC is not 01h), this register is named ABAR. When the programming interface is IDE, this register becomes SIDPBA. Note that hardware does not clear those BA bits when switching from IDE SKU to non-IDE SKU or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after SKU switching (as indicated by a change in CC.SCC). In the case, this register will then have to be re-programmed to a proper value. When the programming interface is not IDE, the register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. When the programming interface is IDE, the register becomes an I/O BAR allocating 16 bytes of I/O space for the I/O mapped registers defined in Memory Registers. Note that although 16 bytes of locations are allocated, only 8 bytes are used as SINDX and SDATA registers; with the remaining 8 bytes preserved for future enhancement.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**ABAR:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
BA							PF	TP	RTE

Bit Range	Default & Access	Description
31:4	0h RW	<b>Base Address (BA):</b> When programming interface is non IDE, this is base address of register memory space (aligned to 2 KB). Bits 31:11 are RW, bits 10:4 are RO of 0; When programming interface is IDE, this is base address of the I/O space. Bits 31:16 are RO of 0, bits 15:4 are RW
3	0h RO	<b>Prefetchable (PF):</b> When programming interface is non IDE, this indicates that this range is not prefetch-able
2:1	0h RO	<b>Type (TP):</b> When programming interface is non IDE, this indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	<b>Resource Type Indicator (RTE):</b> When programming interface is non IDE, this indicates a request for register memory space; When programming interface is IDE, this indicates a request for IO space.

### 17.5.16 Sub System Identifiers (SS)—Offset 2Ch

This register is initialized to logic 0 by the assertion of Backbone Reset. This register can be written only once after Backbone Reset de-assertion.

#### Access Method

**Type:** PCI Configuration Register (Size: 32 bits) **SS:** [B:0, D:19, F:0] + 2Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SSID				SSVID				

Bit Range	Default & Access	Description
31:16	0000h RW/O	<b>Subsystem ID (SSID):</b> This is written by BIOS. No hardware action taken on this value.
15:0	0000h RW/O	<b>Subsystem Vendor ID (SSVID):</b> This is written by BIOS. No hardware action taken on this value.

### 17.5.17 Capabilities Pointer (CAP)—Offset 34h

#### Access Method

**Type:** PCI Configuration Register (Size: 8 bits) **CAP:** [B:0, D:19, F:0] + 34h

**Default:** 80h

7	4	0
1	0	0
C		

Bit Range	Default & Access	Description
7:0	80h RW/L	<b>Capability Pointer (CP):</b> Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default which is meant for non-IDE mode: CAP.CP - 80h (MSI) - 70h (PCI Power) - A8h (SATA) - 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability.[Br] If BIOS intends to operate in IDE mode, BIOS is requested to program this field to 70h and the subsequent capability list as such: CAP.CP - 70h (PCI Power) - end. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.

### 17.5.18 Interrupt Information (INTR)—Offset 3Ch

#### Access Method

**Type:** PCI Configuration Register (Size: 16 bits) **INTR:** [B:0, D:19, F:0] + 3Ch

**Default:** 0100h

15	12	8	4	0
0	0	0	0	0
0	0	0	1	0
0	0	0	0	0
0	0	0	0	0
IPIN				ILINE

Bit Range	Default & Access	Description
15:8	01h RO	<b>Interrupt Pin (IPIN):</b> This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#.
7:0	00h RW	<b>Interrupt Line (ILINE):</b> Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

### 17.5.19 Minimum Grant (MGNT)—Offset 3Eh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**MGNT:** [B:0, D:19, F:0] + 3Eh

**Default:** 00h

7	4	0
0	0	0
0	0	0
0	0	0
MGNT		

Bit Range	Default & Access	Description
7:0	00h RO	<b>MGNT:</b> Minimum Grant

### 17.5.20 Maximum Latency (MLAT)—Offset 3Fh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**MLAT:** [B:0, D:19, F:0] + 3Fh

**Default:** 00h

7	4	0
0	0	0
0	0	0
0	0	0
MLAT		

Bit Range	Default & Access	Description
7:0	00h RO	<b>MLAT:</b> Maximum Latency

## 17.5.21 Primary Timing (PTIM)—Offset 40h

This controls the timings driven on the parallel cable.

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PTIM:** [B:0, D:19, F:0] + 40h

**Default:** 0000h

15		12		8		4		0				
0	0	0	0	0	0	0	0	0				
DE	D1STE	ISP	RSVD0	RCT	DTE1	PPE1	IE1	TIM1	DTE0	PPE0	IE0	TIM0

Bit Range	Default & Access	Description
15	0h RW	<b>Decode Enable (DE):</b> Enables the SATA Controller to decode the Command Blocks (1F0-1F7h for primary, 170-177h for secondary or their native BAR equivalents) and Control Block (3F6h for primary and 376h for secondary or their native BAR equivalents). This bit still has functionality in SATA - if this bit is not set, the port that is mapped to this range will not be decoded.
14	0h RW	<b>Device 1 Separate Timing Enable (D1STE):</b> This register is not used by SATA controller.
13:12	0h RW	<b>IORDY Sample Point (ISP):</b> This register is not used by SATA controller.
11:10	0b RO	<b>RSVD0:</b> Reserved
9:8	0h RW	<b>Recovery Time (RCT):</b> This register is not used by SATA controller.

6	0h RW	<b>Device 1 Prefetch/Posting Enable (PPE1):</b> This register is not used by SATA controller.
5	0h RW	<b>Device 1 IORDY Sample Point Enable (IE1):</b> This register is not used by SATA controller.
4	0h RW	<b>Device 1 Fast Timing Bank (TIM1):</b> This register is not used by SATA controller.
3	0h RW	<b>Device 0 DMA Timing Enable (DTE0):</b> This register is not used by SATA controller.
2	0h RW	<b>Device 0 Prefetch/Posting Enable (PPE0):</b> This register is not used by SATA controller.
1	0h RW	<b>Device 0 IORDY Sample Point Enable (IE0):</b> This register is not used by SATA controller.
0	0h RW	<b>Device 0 Fast Timing Bank (TIM0):</b> This register is not used by SATA controller.

### 17.5.23 Device 1 IDE Timing (D1TIM)—Offset 44h

This register is not used by SATA controller.

#### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)      **D1TIM:** [B:0, D:19, F:0] + 44h

**Default:** 00h

7	4	0
0	0	0
RSVD		

Bit Range	Default & Access	Description
7:0	0h RW	<b>RSVD:</b> Reserved

### 17.5.24 Synchronous DMA Control (Synchronous\_DMA\_Control)—Offset 48h

This register is not used by SATA controller.

#### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)      **Synchronous\_DMA\_Control:** [B:0, D:19, F:0] + 48h

**Default:** 00h

7	4	0
0	0	0
RSVD		

Bit Range	Default & Access	Description
7:0	0h RW	<b>RSVD:</b> Reserved

### 17.5.25 Synchronous\_DMA\_Timing—Offset 4Ah

This register is not used by SATA controller.

#### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)      **Synchronous\_DMA\_Timing:** [B:0, D:19, F:0] + 4Ah

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
RSVD				

Bit Range	Default & Access	Description
15:0	0h RW	<b>RSVD:</b> Reserved

### 17.5.26 IDE I/O Configuration (IIOC)—Offset 54h

This register is not used by SATA controller.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**IIOC:** [B:0, D:19, F:0] + 54h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD								

Bit Range	Default & Access	Description
31:0	0h RW	<b>RSVD:</b> Reserved

### 17.5.27 PCI Power Management Capability ID (PID)—Offset 70h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PID:** [B:0, D:19, F:0] + 70h

**Default:** A801h

15	12	8	4	0											
1	0	1	0	1	0	0	0	0	0	0	0	0	0	0	1
NEXT								CID							

Bit Range	Default & Access	Description
15:8	A8h RW/L	<b>Next Capability (NEXT):</b> A8h is location of the Serial ATA Capability structure. This is recommended for non-IDE mode. If the controller is to operate in IDE mode, BIOS is requested to program this field to 00h indicating the end (recommended setting). The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	01h RO	<b>Cap ID (CID):</b> Indicates that this pointer is a PCI power management capability.

### 17.5.28 PCI Power Management Capabilities (PC)—Offset 72h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PC:** [B:0, D:19, F:0] + 72h

**Default:** 4003h

15	12	8	4	0				
0	1	0	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	1	1					
PME_Support		D2_Support	D1_Support	Aux_Current	DSI	RSVD0	PMEC	VS

Bit Range	Default & Access	Description
15:11	08h RO	<b>PME_Support:</b> By default with CC.SCC=01h, the default value is 00000 which indicates no PME Support in IDE mode. When CC.SCC is not 01h in non-IDE mode, the default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	<b>D2_Support:</b> The D2 state is not supported.
9	0h RO	<b>D1_Support:</b> The D1 state is not supported.
8:6	0h RO	<b>Aux_Current:</b> PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	<b>Device Specific Initialization (DSI):</b> Indicates that no device-specific initialization is required.
4	0b RO	<b>RSVD0:</b> Reserved
3	0h RO	<b>PME Clock (PMEC):</b> Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	<b>Version (VS):</b> Indicates support for Revision 1.2 of the PCI Power Management Specification.

## 17.5.29 PCI Power Management Control and Status (PMCS)—Offset 74h

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PMCS:** [B:0, D:19, F:0] + 74h

**Default:** 0008h

15	12	8	4	0		
0	0	0	0	0		
0	0	0	0	0		
0	0	0	0	0		
0	0	0	0	0		
0	0	0	0	0		
1	0	0	0	0		
0	0	0	0	0		
PMES	RSVD0	PMEE	RSVD1	NSFRST	RSVD2	PS

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PMES):</b> This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. -Note: Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0.
14:9	0b RO	<b>RSVD0:</b> Reserved

Bit Range	Default & Access	Description
8	0h RW	<b>PME Enable (PMEE):</b> When CC.SCC is not 01h, this bit is RW. When set, the SATA controller generates PME# from D3HOT on a wake event. Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0 since there is no PME Support in IDE mode. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru MAP.SMS.
7:4	0b RO	<b>RSVD1:</b> Reserved
3	1h RO	<b>No Soft Reset (NSFRST):</b> A 1 indicates that devices transitioning from D3hot to D0 because of Power_State commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the Power_State bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0b RO	<b>RSVD2:</b> Reserved
1:0	0h RW	<b>Power State (PS):</b> This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to PCI PM specification section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

### 17.5.30 Message Signaled Interrupt Identifier (MID)—Offset 80h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**MID:** [B:0, D:19, F:0] + 80h

**Default:** 7005h

15	12	8	4	0
0	1	1	1	0
		0	0	0
		0	0	0
				0
				0
				1
				0
				1
NEXT				CID

Bit Range	Default & Access	Description
15:8	70h RW/L	<b>Next Pointer (NEXT):</b> Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	05h RO	<b>Capability ID (CID):</b> Capabilities ID indicates MSI.

### 17.5.31 Message Signaled Interrupt Message Control (MC)—Offset 82h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**MC:** [B:0, D:19, F:0] + 82h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
RSVD0		C64	MME	MMC
				MSIE

Bit Range	Default & Access	Description
15:8	0b RO	<b>RSVD0:</b> Reserved
7	0h RO	<b>64 Bit Address Capable (C64):</b> Capable of generating a 32-bit message only.
6:4	0h RO	<b>Multiple Message Enable (MME):</b> When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	<b>Multiple Message Capable (MMC):</b> Not supported.
0	0h RW	<b>MSI Enable (MSIE):</b> If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field. Software must also make sure this bit is cleared to 0 when operating in legacy mode (for AHCI SKUs when GHC.AE = 0). This bit is RW when CC.SCC is not 01h and is read-only 0 when CC.SCC is 01h.

### 17.5.32 Message Signaled Interrupt Message Address (MA)—Offset 84h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**MA:** [B:0, D:19, F:0] + 84h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ADDR								RSVD0

Bit Range	Default & Access	Description
31:2	0h RW	<b>Address (ADDR):</b> Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0b RO	<b>RSVD0:</b> Reserved

### 17.5.33 Message Signaled Interrupt Message Data (MD)—Offset 88h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**MD:** [B:0, D:19, F:0] + 88h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
DATA				

Bit Range	Default & Access	Description
15:0	0h RW	<b>Data (DATA):</b> This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

### 17.5.34 Port Mapping Register (MAP)—Offset 90h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**MAP:** [B:0, D:19, F:0] + 90h

**Default:** 0420h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
RSVD0		SPD0	SPD	SMS
			SC	RSVD1
				MV

Bit Range	Default & Access	Description
15:12	0b RO	<b>RSVD0:</b> Reserved
11:10	1h RO	<b>SATA Port Disable (SPD0):</b> A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SP0. And only then BIOS configures the PCS.PxE.
9:8	0h RO	<b>SATA Port Disable (SPD):</b> A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SP0. And only then BIOS configures the PCS.PxE.
7:6	0h RW	<b>SATA Mode Select (SMS):</b> Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 00b = IDE mode which requires LBC01.LBGE=1 (refer to LBC01, LBC23 and LBC45 register in SIR register space); 01b = AHCI mode; 10b = RAID mode; 11b = Reserved. Notes : SW shall not manipulate MAP.SMS during runtime operation; i.e. the OS will not do this. The BIOS may choose to switch from one mode to another during POST. IDE mode can be selected when AHCI and/or RAID are enabled. After switching from AHCI/RAID back to IDE mode, the number of usable ports on SATA Controller 1 shall be reduced to 4, dependent on SKUs. AHCI mode may only be selected when MV = 00b. AHCI mode may be selected when RAID feature is enabled by fuse. VLV does not support RAID mode. Programming these bits with values that are illegal will result in in-deterministic behavior by the HW.

Bit Range	Default & Access	Description
5	1h RW	<b>SATA Port-to-Controller Configuration (SC):</b> This bit changes number of SATA port availability within each SATA controller. When MAP.SPD[5] is 1 and MAP.SPD[4] is 1, this bit is reserved and is read-only 1 else it's RW-zero. When this bit is 0: Up to 2 SATA ports are available in the SATA controller 1 with port[1:0]. When this bit to 1: Up to 2 SATA ports are available in the SATA controller 1 with port [1:0]. For SMS=IDE mode, this bit should be 0 (note that this irrespective of the number of SATA ports). The number of port availability in this controller shall be discoverable thru this controller's config PCS.PxE, AHCI CAP.NP and AHCI PI[x] register fields. Prior to changing the state of this bit, all ports must be in quiescent state with no commands outstanding. Refer to Single and Dual Controller Switching Requirement for additional software and hardware requirements.
4:2	0b RO	<b>RSVD1:</b> Reserved
1:0	0h RO	<b>Map Value (MV):</b> This register is reserved.

### 17.5.35 Port Control and Status (PCS)—Offset 92h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == 0) as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to 1 prior to booting the OS, regardless as to whether or not a device is currently on the port.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PCS:** [B:0, D:19, F:0] + 92h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
ORM	RSVD0	RSVD	PIP	POP
			RSVD1	PIE
				POE

Bit Range	Default & Access	Description
15	0h RW	<b>OOB Retry Mode (ORM):</b> When cleared, the SATA controller will not retry after an OOB failure. When set, the SATA controller will continue to retry after an OOB failure until successful (infinite retry). BIOS is requested to program this field to 1.
14	0b RO	<b>RSVD0:</b> Reserved
13:10	0h RO	<b>RSVD:</b> Reserved
9	0h RO	<b>Port 1 Present (P1P):</b> Same as POP, except for port 1.

Bit Range	Default & Access	Description
8	0h RO	<b>Port 0 Present (POP)</b> : When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing POE bit leads to clearing of this bit after implementation delay. Note: For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting POE bit to 1.
7:2	0b RO	<b>RSVD1</b> : Reserved
1	0h RW	<b>Port 1 Enabled (P1E)</b> : When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as POE but for port 1 and takes precedence over P1CMD.SUD.
0	0h RW	<b>Port 0 Enabled (POE)</b> : When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. Note: The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 2 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us.

### 17.5.36 Test Mode Register (TM)—Offset 94h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**TM:** [B:0, D:19, F:0] + 94h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
	RSVD	PCD			RSVD0			

Bit Range	Default & Access	Description
31:26	0h RO	<b>Reserved (RSVD)</b> : Reserved.
25:24	0h RW	<b>Port Clock Disable (PCD)</b> : When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally.
23:0	0b RO	<b>RSVD0</b> : Reserved

### 17.5.37 SATA General Configuration (SATAGC)—Offset 9Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SATAGC:** [B:0, D:19, F:0] + 9Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
REGLOCK	RSVD0			WRRSELMP	RSVD1	URRE	URD	AIE	DEVIDSEL	FLRCSEL	RSVD2

Bit Range	Default & Access	Description
31	0h RW/O	<b>Register Lock (REGLOCK):</b> BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is requested to program this field to 1 prior to hand off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process.
30:15	0b RO	<b>RSVD0:</b> Reserved
14:12	0h RW	<b>Write Request Size Select/Max Payload Size (WRRSELMP):</b> These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller.
11:10	0b RO	<b>RSVD1:</b> Reserved
9	0h RW	<b>Unsupported Request Reporting Enable (URRE):</b> If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C	<b>Unsupported Request Detected (URD):</b> Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	<b>Alternate ID Enable (AIE):</b> When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. The value is product specific. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by Backbone Reset and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime.
6	0h RW/O	<b>AIE0 DevID Selection (DEVIDSEL):</b> This register allows BIOS to select Device ID when AIE=0 and Server Feature Disable Fuse 7 =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. 0 : 2822h; 1 : 2826h. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse 7 is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h.
5	0h RW/O	<b>FLR Capability Selection (FLRCSEL):</b> This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is requested to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h.
4:0	0b RO	<b>RSVD2:</b> Reserved

### 17.5.38 SATA Initialization Register Index (SIRI)—Offset A0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SIRI:** [B:0, D:19, F:0] + A0h

**Default:** 00h

7	4	0
0	0	0
IDX		RSVD0

Bit Range	Default & Access	Description
7:2	00h RW	<b>Index (IDX):</b> 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Note that this 256-byte register space setting is applicable to all ports in both SATA controllers 1 and 2 (if supported). Refer to SATA Initialization Register section for detail of the register space.
1:0	0b RO	<b>RSVD0:</b> Reserved

### 17.5.39 SATA Initialization Register Data (SIRD)—Offset A4h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SIRD:** [B:0, D:19, F:0] + A4h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
DTA								

Bit Range	Default & Access	Description
31:0	00000000h RW	<b>Data (DTA):</b> 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

### 17.5.40 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

This register shall be read-only 0 when CC.SCC is 01h. Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SATACR0:** [B:0, D:19, F:0] + A8h

**Default:** 00100012h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0
RSVD0				MAJREV	MINREV	NEXT	CAP	

Bit Range	Default & Access	Description
31:24	0b RO	<b>RSVD0:</b> Reserved
23:20	1h RO	<b>Major Revision (MAJREV):</b> Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	<b>Minor Revision (MINREV):</b> Minor revision number of the SATA Capability Pointer implemented.
15:8	00h RW/L	<b>Next Capability Pointer (NEXT):</b> 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	12h RO	<b>Capability ID (CAP):</b> The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

### 17.5.41 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

This register shall be read-only 0 when CC.SCC is 01h.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SATACR1:** [B:0, D:19, F:0] + ACh

**Default:** 00000048h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0				BAROFFST				BARLOC

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:4	004h RO	<b>BAR Offset (BAROFFST):</b> Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset ... FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	<b>BAR Location (BARLOC):</b> Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h (=) BAR0; 0101b = 14h (=) BAR1; 0110b = 18h (=) BAR2; 0111b = 1Ch (=) BAR3; 1000b = 20h (=) LBAR; 1001b = 24h (=) BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

## 17.5.42 FLR Capability ID (FLRCID)—Offset B0h

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**FLRCID:** [B:0, D:19, F:0] + B0h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
NEXT			CID	

Bit Range	Default & Access	Description
15:8	00h RO	<b>Next Capability (NEXT):</b> 00h indicating the final item in the Capability List.
7:0	00h RO	<b>Capability ID (CID):</b> The value of this field depends on the FLRCSSEL bit. SATAGC.FLRCSSEL = 0, Capability ID = 13h; SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

## 17.5.43 FLR Control (FLRCTL)—Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**FLRCTL:** [B:0, D:19, F:0] + B4h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
RSVD				

Bit Range	Default & Access	Description
15:0	0h RO	<b>RSVD:</b> Reserved

## 17.5.44 Scratch Pad (SP)—Offset D0h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SP:** [B:0, D:19, F:0] + D0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
D								

Bit Range	Default & Access	Description
31:0	0h RW	<b>Data (DT):</b> This is a read/write register that is available for software to use. No hardware action is taken on this register.

## 17.5.45 BIST FIS Control/Status (BFCS)—Offset E0h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BFCS:** [B:0, D:19, F:0] + E0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
RSVD0						BFS	BFF	P1BFI	
						POBFI	BFP		RSVD1

Bit Range	Default & Access	Description
31:12	0b RO	<b>RSVD0:</b> Reserved
11	0h RW	<b>BIST FIS Successful (BFS):</b> This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device
10	0h RW	<b>BIST FIS Failed (BFF):</b> This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device
9	0h RW	<b>Port 1 BIST FIS Initiate (P1BFI):</b> When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
8	0h RW	<b>Port 0 BIST FIS Initiate (POBFI):</b> When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
7:2	0h RW	<b>BIST FIS Parameters (BFP):</b> These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0b RO	<b>RSVD1:</b> Reserved

## 17.5.46 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BFTD1:** [B:0, D:19, F:0] + E4h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA																											

Bit Range	Default & Access	Description
31:0	0h RW	<b>Data (DATA):</b> The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

### 17.5.47 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

#### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)      **BFTD2:** [B:0, D:19, F:0] + E8h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA																											

Bit Range	Default & Access	Description
31:0	0h RW	<b>Data (DATA):</b> The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

### 17.5.48 Manufacturing ID (MFID)—Offset F8h

#### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)      **MFID:** [B:0, D:19, F:0] + F8h

**Default:** 08000FB1h

31	28	24	20	16	12	8	4	0																			
0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	1	0	0	0	1
RSVDO				DPID				SID				MID				PID											

Bit Range	Default & Access	Description
31:28	0b RO	<b>RSVDO:</b> Reserved

Bit Range	Default & Access	Description
27:24	8h RO	<b>Dot portion of Process ID (DPID):</b> Indicates the dot. Process is reflected in bits [7:0]. The value is product specific.
23:16	0h RO	<b>Stepping Identifier (SID):</b> This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. The value is product specific.
15:8	0Fh RO	<b>Manufacturer Identifier (MID):</b> Indicates Intel.
7:0	B1h RO	<b>Process/Dot Identifier (PID):</b> Indicates the Process. Dot is reflected in bits [27:24]. The value is product specific.

## 17.6 SATA Legacy IO Registers

**Table 194. Summary of SATA Legacy I/O Registers—LBAR**

Offset	Size	Register ID—Description	Default Value
0h	1	"Primary Command (PCMD)—Offset 0h" on page 1961	00h
2h	1	"Primary Status (PSTS)—Offset 2h" on page 1962	00h
4h	4	"Primary Descriptor Table Pointer (PDTP)—Offset 4h" on page 1962	00000000h
8h	1	"Secondary Command (SCMD)—Offset 8h" on page 1963	00h
Ah	1	"Secondary Status (SSTS)—Offset Ah" on page 1963	00h
Ch	4	"Secondary Descriptor Table Pointer (SDTP)—Offset Ch" on page 1964	00000000h
10h	4	"AHCI Index Register (INDEX)—Offset 10h" on page 1965	00000000h
14h	4	"AHCI Data Register (DATA)—Offset 14h" on page 1966	00000000h

### 17.6.1 Primary Command (PCMD)—Offset 0h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**PCMD:** [LBAR] + 0h

**LBAR Type:** PCI Configuration Register (Size: 32 bits)

**LBAR Reference:** [B:0, D:19, F:0] + 20h

**Default:** 00h

7	4	0
0	0	0
RSVD0	RWC	RSVD1
		START

Bit Range	Default & Access	Description
7:4	0b RO	<b>RSVD0:</b> Reserved
3	0h RW	<b>Read / Write Control (RWC):</b> Sets the direction of the bus master transfer: 0 = memory to device, 1 = device to memory. This bit must not be changed when the bus master function is active.
2:1	0b RO	<b>RSVD1:</b> Reserved
0	0h RW	<b>Start/Stop Bus Master (START):</b> Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation. All state information is lost when this bit is written to 0; Master mode operation cannot be stopped and then resumed. If this bit is reset while bus master operation is still active and the device has not yet finished its data transfer, the bus master command is said to be aborted. If this bit is cleared to 0 prior to the DMA data transfer being initiated by the drive in a device to memory data transfer, then not DMAT will be sent to terminate the data transfer. SW intervention (e.g. sending SRST) is required to reset the interface in this condition. This bit is intended to be cleared by software after the data transfer is completed - as indicated by either the ACT bit being cleared in the status register, or the I bit being set in the status register, or both.

## 17.6.2 Primary Status (PSTS)—Offset 2h

### Access Method

Type: I/O Register  
(Size: 8 bits)

PSTS: [LBAR] + 2h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
S	D1DC	D0DC		RSVD0		I	ERR	ACT

Bit Range	Default & Access	Description
7	0h RO	<b>Simplex Only (S):</b> This read-only bit indicates whether or not I both bus master channels (primary and secondary) can be operated at the same time. If the bit is a 0, then the channels operate independently and can be used at the same time. If the bit is a 1, then only one channel may be used at a time.
6	0h RW	<b>Device 1 DMA Capable (D1DC):</b> A scratchpad bit set by SW to indicate that device 1 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
5	0h RW	<b>Device 0 DMA Capable (D0DC):</b> A scratchpad bit set by SW to indicate that device 0 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
4:3	0b RO	<b>RSVD0:</b> Reserved
2	0h RW/1C	<b>Interrupt (I):</b> This bit is set when a device FIS is received with the I bit has been set provided that software has not disabled interrupt via the nIEN bit of Device Control Register.
1	0h RW/1C	<b>Error (ERR):</b> This bit is set when the controller encounters an error during the transfer and must stop the transfer. See Error Handling for the list of errors that set this bit.
0	0h RO	<b>Active (ACT):</b> Set by the host when the START bit is written to the Command register, and cleared by the host when the last transfer for a region is performed, where EOT for that region is set in the region descriptor, and when the START bit is cleared in the Command register and the controller has returned to an idle condition.

## 17.6.3 Primary Descriptor Table Pointer (PDTP)—Offset 4h

### Access Method

Type: I/O Register  
(Size: 32 bits)

PDTP: [LBAR] + 4h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h

1:0	0b RO	<b>RSVDO:</b> Reserved

## 17.6.7 AHCI Index Register (INDEX)—Offset 10h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEXT/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**INDEX:** [LBAR] + 10h

**LBAR Type:** PCI Configuration Register (Size: 32 bits)

**LBAR Reference:** [B:0, D:19, F:0] + 20h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSVD0								INDEX	RSVD1		

Bit Range	Default & Access	Description
31:11	0b RO	<b>RSVD0:</b> Reserved
10:2	000h RO	<b>Index (INDEX):</b> This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0b RO	<b>RSVD1:</b> Reserved

### 17.6.8 AHCI Data Register (DATA)—Offset 14h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEXT/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**DATA:** [LBAR] + 14h

**LBAR Type:** PCI Configuration Register (Size: 32 bits)

**LBAR Reference:** [B:0, D:19, F:0] + 20h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	<b>Data (DATA):</b> This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

## 17.7 SATA Index Pair IO Registers

**Table 195. Summary of SATA Index Pair I/O Registers—ABAR**

Offset	Size	Register ID—Description	Default Value
0h	4	“Serial ATA Index (SINDX)—Offset 0h” on page 1967	00000000h
4h	4	“Serial ATA Data (SDATA)—Offset 4h” on page 1968	00000000h

### 17.7.1 Serial ATA Index (SINDX)—Offset 0h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**SINDX:** [ABAR] + 0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0				PIDX			RIDX	

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:8	00h RW	<b>Port Index (PIDX):</b> This index field is used to specify the port of the SATA controller that the port specific SerialATA Status (SSTS), SerialATA Control (SCTL) and SerialATA Error (SERR) registers are to be read from or write to. 00h = Primary Master (Port 0); 01h = Primary Slave (Port 2); 02h = Secondary Master (Port 1); 03h = Secondary Slave (Port 3).
7:0	00h RW	<b>Register Index (RIDX):</b> This index field is used to specify one out of three registers currently being indexed into. These three registers are the Serial ATA superset SStatus, SControl and SError memory registers and are port specific, hence for this SATA controller, there are four sets of these registers. Refer to Offset 128h, 1A8h, 228h, 2A8h, 328h, 3A8h: PxSSTS - Port [0-5] Serial ATA Status, Offset 12Ch, 1ACh, 22Ch, 2ACh, 32Ch, 3ACh: PxSCTL - Port [0-5] Serial ATA Control, and Offset 130h, 1B0h, 230h, 2B0h, 330h, 3B0h: PxSERR - Port [0-5] Serial ATA Error for definitions of the SStatus, SControl and SError registers. 00h = SSTS; 01h = SCTL; 02h = SERR.

## 17.7.2 Serial ATA Data (SDATA)—Offset 4h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**SDATA:** [ABAR] + 4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
DATA											

Bit Range	Default & Access	Description
31:0	00000000h RW	<b>Data (DATA):</b> This Data register is a window through which data is read or written to from the register pointed to by the Serial ATA Index (SINDX) register above. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by SINDX.RIDX field.

## 17.8 SATA AHCI Memory Mapped IO Registers

### 17.8.1 HBA Capabilities (GHC\_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GHC\_CAP:** [ABAR] + 0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** DF20FF02h

31	28	24	20	16	12	8	4	0																
1	1	0	1	1	1	1	1	0	0	1	0	0	0	0	1	1	0	0	0	0	0	1	0	
S64A	SCQA	SSNTF	SMPS	SSS	SALP	SAL	SCLO	ISS	SNZO	SAM	SMP	FBSS	PMD	SSC	PSC	NCS	CCCS	EMS	SXS	NP				

Bit Range	Default & Access	Description
31	1h RW/O	<b>Supports 64-bit Addressing (S64A):</b> Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	<b>Supports Native Command Queuing Acceleration (SCQA):</b> Indicates the SATA controller supports Serial-ATA Native Command Queuing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	0h RO	<b>Supports SNotification Register (SSNTF):</b> When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0, the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	<b>Supports Mechanical Presence Switch (SMPS):</b> When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	<b>Supports Staggered Spin-up (SSS):</b> Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.
26	1h RW/O	<b>Supports Aggressive Link Power Management (SALP):</b> Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.

Bit Range	Default & Access	Description
25	1h RW/O	<b>Supports Activity LED (SAL):</b> Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	<b>Supports Command List Override (SCL0):</b> When set to 1, indicates that the HBA supports the PxCMD.CLO bit and its associated function. When cleared to 0, The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue software reset if these bits are still set from a previous operation.
23:20	2h RW/O	<b>Interface Speed Support (ISS):</b> Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved.
19	0h RO	<b>Supports Non-Zero DMA Offsets (SNZO):</b> Reserved as per AHCI 1.3
18	0h RW/O	<b>Supports AHCI mode only (SAM):</b> The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	0h RO	<b>Supports Port Multiplier (SMP):</b> Not supported.
16	0h RO	<b>FIS-based Switching Supported (FBSS):</b> Not supported.
15	1h RO	<b>PIO Multiple DRQ Block (PMD):</b> If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	<b>Slumber State Capable (SSC):</b> The SATA controller supports the slumber state.
13	1h RW/O	<b>Partial State Capable (PSC):</b> The SATA controller supports the partial state.
12:8	1Fh RO	<b>Number of Command Slots (NCS):</b> 1Fh indicating support for 32 slots.
7	0h RO	<b>Command Completion Coalescing Supported (CCCS):</b> When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RO	<b>Enclosure Management Supported (EMS):</b> Not supported
5	0h RW/O	<b>Supports External SATA (SXS):</b> When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	02h RO	<b>Number of Ports (NP):</b> 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 2 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

## 17.8.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GHC:** [ABAR] + 4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
AE	RSVD0						MRSM	IE	HR

Bit Range	Default & Access	Description
31	0h RW	<b>AHCI Enable (AE):</b> When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0b RO	<b>RSVD0:</b> Reserved
2	0h RO	<b>MSI Revert to Single Message (MRSM):</b> When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME ( MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC = 0 (multiple messages requested); MC.MME = 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	<b>Interrupt Enable (IE):</b> This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	<b>HBA Reset (HR):</b> When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the AHCI specification, section 10.3.3.

### 17.8.3 Interrupt Status (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**IS:** [ABAR] + 8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
RSVD0								IPS1	IPS0

Bit Range	Default & Access	Description
31:2	0b RO	<b>RSVD0:</b> Reserved
1	0h RW/1C	<b>Interrupt Pending Status Port 1 (IPS1):</b> If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C	<b>Interrupt Pending Status Port 0 (IPS0):</b> If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

### 17.8.4 Ports Implemented (GHC\_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GHC\_PI:** [ABAR] + Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
RSVD0								PI1	PI0

Bit Range	Default & Access	Description
31:2	0b RO	<b>RSVD0:</b> Reserved

Bit Range	Default & Access	Description
1	0h RW/O	<b>Port 1 Implemented (PI1):</b> If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O	<b>Port 0 Implemented (PI0):</b> If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

### 17.8.5 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**VS:** [ABAR] + 10h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00010300h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	0	0	0
MJR				MNR				

Bit Range	Default & Access	Description
31:16	0001h RO	<b>Major Version Number (MJR):</b> Indicates the major version is 1
15:0	0300h RO	<b>Minor Version Number (MNR):</b> Indicates the minor version is 30

### 17.8.6 HBA Capabilities Extended (GHC\_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GHC\_CAP2:** [ABAR] + 24h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 0000003Ch

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	0				
RSVD0							DES0	SADM	SDS	APST	RSVD1	BOH

Bit Range	Default & Access	Description
31:6	0b RO	<b>RSVDO:</b> Reserved
5	1h RW/O	<b>DEVSLP Entrance from Slumber Only (DESO):</b> This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is requested to program this field to 1.
4	1h RW/O	<b>Supports Aggressive DEVSLP Management (SADM):</b> When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O	<b>Supports DEVSLP (SDS):</b> When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
2	1h RW/O	<b>Automatic Partial to Slumber Transitions (APST):</b> When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. Note: If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0b RO	<b>RSVD1:</b> Reserved
0	0h RO	<b>BIOS/OS Handoff (BOH):</b> Not supported.

### 17.8.7 Vendor Specific (VSP)—Offset A0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**VSP:** [ABAR] + A0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000048h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:7	0b RO	<b>RSVDO:</b> Reserved
6	1h RO	<b>Software Feature Mask Supported (SFMS):</b> Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO	<b>Premium Features Supported (PFS):</b> Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO	<b>Platform Type (PT):</b> Set to 1 if mobile platform. Clear (0) if desktop.

Bit Range	Default & Access	Description
3	1h RO	<b>Supports RAID Platform ID Reporting (SRPIR):</b> If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0b RO	<b>RSVD1:</b> Reserved

## 17.8.8 Vendor Specific Capabilities (VS\_CAP)—Offset A4h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**VS\_CAP:** [ABAR] + A4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 018002FEh

31	28	24	20	16	12	8	4	0																
0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	1	0	1	1	1	1	1	1	1	0
PNRRO												RSVD0				MSL						PNMBRE		

Bit Range	Default & Access	Description
31:16	0180h RO	<b>PCIe NAND Remapped Register Offset (PNRRO):</b> Specifies the DWORD offset within ABAR as to where the PCIe NAND AHCI BAR register space is remapped. Only valid when PNABRE = 1. This places the start of the PCIe NAND AHCI BAR register space at ABAR + 600h
15:12	0b RO	<b>RSVD0:</b> Reserved
11:1	17Fh RW	<b>Memory Space Limit. (MSL):</b> This field specifies the size of the remapped memory space for the PCIe NAND device. It is a 0-based field. Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated 2k AHCI memory space of the integrated AHCI controller. The reset default of this field is 17Fh (i.e. bit[11:1] = 0010111111b) which specifies the size of the remapped memory space as 384 bytes.
0	0h RW/O	<b>PCIe NAND Memory BAR Remapped Enable (PNMBRE):</b> Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled.

## 17.8.9 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**RPID:** [ABAR] + C0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00311C02h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0

0	0	0	1	1	0	0	0	1
0	0	0	1	0	0	0	1	0
OFST					RPID			

Bit Range	Default & Access	Description
31:16	0031h RO	<b>Offset (OFST):</b> The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO	<b>RAID Platform ID (RPID):</b> Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

### 17.8.10 Premium Feature Block (PFB)—Offset C4h

These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**PFB:** [ABAR] + C4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 0000h

			SOI	

Bit Range	Default & Access	Description
15:5	0b RO	<b>RSVD0:</b> Reserved
4	0h RO	<b>Reserved (RSVD_1):</b> Read value is the same as VSP.PFS.
3	0h RO	<b>Reserved (RSVD_2):</b> Read value is the same as VSP.PFS.
2	0h RO	<b>Reserved (RSVD_3):</b> Read value is the same as VSP.PFS.
1	0h RO	<b>Supports Email Alert (SEA):</b> Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	<b>Supports OEM IOCTL (SOI):</b> Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

## 17.8.11 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS\_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**SFM:** [ABAR] + C8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 003Fh

0	0	0	0	0	0	0	0	0
FB							RSVDO	

Bit Range	Default & Access	Description
31:8	0000000h RW	<b>FIS Base Address (FB):</b> Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0b RO	<b>RSVDO:</b> Reserved

### 17.8.15 Port-FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxFBU0:** [ABAR] + 10Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
FBU								

Bit Range	Default & Access	Description
31:0	00000000h RW	<b>FIS Base Address Upper (FBU):</b> Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

### 17.8.16 Port-Interrupt Status (PxIS0)—Offset 110h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxIS0:** [ABAR] + 110h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0										
0	0	0	0	0	0	0	0	0										
CPDS	TFES	HBFS	HBDS	IFS	INFS	RSVD0	OFS	IPMS	PRCS	RSVD1	DMPS	PCS	DPS	UFS	SDBS	DSS	PSS	DHRS

Bit Range	Default & Access	Description
31	0h RO	<b>Cold Presence Detect Status (CPDS):</b> The SATA controller does not support cold presence detect.
30	0h RW/1C	<b>Task File Error Status (TFES):</b> This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	<b>Host Bus Fatal Error Status (HBFS):</b> Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	<b>Host Bus Data Error Status (HBDS):</b> Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	<b>Interface Fatal Error Status (IFS):</b> Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	<b>Interface Non-fatal Error Status (INFS):</b> Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	<b>RSVD0:</b> Reserved
24	0h RW/1C	<b>Overflow Status (OFS):</b> Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	<b>Incorrect Port Multiplier Status (IPMS):</b> Not supported
22	0h RO	<b>PhyRdy Change Status (PRCS):</b> When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	<b>RSVD1:</b> Reserved
7	0h RW/1C	<b>Device Mechanical Presence Status (DMPS):</b> When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	<b>Port Connect Change Status (PCS):</b> 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	<b>Descriptor Processed (DPS):</b> A PRD with the I. bit set has transferred all of its data.
4	0h RO	<b>Unknown FIS Interrupt (UFS):</b> When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	<b>Set Device Bits Interrupt (SDBS):</b> A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	<b>DMA Setup FIS Interrupt (DSS):</b> A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.

Bit Range	Default & Access	Description
1	0h RW/1C	<b>PIO Setup FIS Interrupt (PSS):</b> A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	<b>Device to Host Register FIS Interrupt (DHRS):</b> A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

## 17.8.17 Port-Interrupt Enable (PxIE0)—Offset 114h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxIE0:** [ABAR] + 114h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	0h RO	<b>Cold Presence Detect Enable (CPDS):</b> The SATA controller does not support cold presence detect.
30	0h RW	<b>Task File Error Enable (TFEE):</b> When set, GHC.IE is set, and POS.TFES is set, the HBA shall generate an interrupt.
29	0h RW	<b>Host Bus Fatal Error Enable (HBFE):</b> When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	<b>Host Bus Data Error Enable (HBDE):</b> When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	<b>Interface Fatal Error Enable (IFE):</b> When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	<b>Interface Non-fatal Error Enable (INFE):</b> When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	<b>RSVD0:</b> Reserved
24	0h RW	<b>Overflow Enable (OFE):</b> When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	<b>Incorrect Port Multiplier Enable (IPME):</b> When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	<b>PhyRdy Change Interrupt Enable (PRCE):</b> When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	<b>RSVD1:</b> Reserved
7	0h RW	<b>Device Mechanical Enable (DMPE):</b> When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
6	0h RW	<b>Port Change Interrupt Enable (PCE):</b> When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	<b>Descriptor Processed Interrupt Enable (DPE):</b> When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	<b>Unknown FIS Interrupt Enable (UFE):</b> When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	<b>Set Device Bits FIS Interrupt Enable (SDBE):</b> When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	<b>DMA Setup FIS Interrupt Enable (DSE):</b> When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	<b>PIO Setup FIS Interrupt Enable (PSE):</b> When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	<b>Device to Host Register FIS Interrupt Enable (DHRE):</b> When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

## 17.8.18 Port-Command (PxCMD0)—Offset 118h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxCMD0:** [ABAR] + 118h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000004h

31	28	24	20	16	12	8	4	0																
0	0	0	0	0	0	0	0	0																
0	0	0	0	0	0	0	0	0																
0	0	0	0	0	0	0	0	0																
ICC	ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD0	CR	FR	MPSS	CCS	RSVD1	PSP	APSE	FRE	CLO	POD	SUD	ST

Bit Range	Default & Access	Description
31:28	0h RW	<b>Interface Communication Control (ICC):</b> This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.
27	0h RW	<b>Aggressive Slumber Partial (ASP):</b> When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleared to 0, software shall treat this bit as reserved.
26	0h RW	<b>Aggressive Link Power Management Enable (ALPE):</b> When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	<b>Drive LED on ATAPI Enable (DLAE):</b> When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software

Bit Range	Default & Access	Description
24	0h RW	<b>Device is ATAPI (ATAPI):</b> When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	<b>Automatic Partial to Slumber Transitions Enabled (APSTE):</b> When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	<b>FIS-based Switching Capable Port (FBSCP):</b> The SATA controller does not support FIS-Based Switching.
21	0h RW/O	<b>External SATA Port (ESP):</b> When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.
20	0h RO	<b>Cold Presence Detection (CPD):</b> The SATA controller does not support cold presence detect.
19	0h RW/O	<b>Mechanical Presence Switch Attached to Port (MPSP):</b> If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	<b>Hot Plug Capable Port (HPCP):</b> This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	<b>Port Multiplier Attached (PMA):</b> Not supported
16	0b RO	<b>RSVD0:</b> Reserved
15	0h RO	<b>Command List Running (CR):</b> When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	<b>FIS Receive Running (FR):</b> When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	<b>Mechanical Presence Switch State (MPSS):</b> The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	00h RO	<b>Current Command Slot (CCS):</b> Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCMD.CCS is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	<b>RSVD1:</b> Reserved
6	0h RO	<b>PHYSLP Present (PSP):</b> If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.

Bit Range	Default & Access	Description
5	0h RW	<b>Aggressive PHYSLP Enable (APSE):</b> This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	<b>FIS Receive Enable (FRE):</b> When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	<b>Command List Override (CLO):</b> Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	<b>Power On Device (POD):</b> The SATA controller does not support cold presence detect.
1	0h RW	<b>Spin-Up Device (SUD):</b> This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to 0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	<b>Start (ST):</b> When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

## 17.8.19 Port-Task File Data (PxTFD0)—Offset 120h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxTFD0:** [ABAR] + 120h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0				IPM	SPD	DET		

Bit Range	Default & Access	Description
31:12	0b RO	<b>RSVD0:</b> Reserved

Bit Range	Default & Access	Description
11:8	0h RO	<b>Interface Power Management (IPM):</b> Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	<b>Current Interface Speed (SPD):</b> Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	<b>Device Detection (DET):</b> Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

## 17.8.22 Port-Serial ATA Control (PxSCTL0)—Offset 12Ch

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSCTL0:** [ABAR] + 12Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0				PMP	SPM	IPM	SPD	DET											

Bit Range	Default & Access	Description
31:20	0b RO	<b>RSVD0:</b> Reserved
19:16	0h RW	<b>Port Multiplier Port (PMP):</b> This field is not used by AHCI.
15:12	0h RW	<b>Select Power Management (SPM):</b> This field is not used by AHCI.
11:8	0h RW	<b>Interface Power Management Transitions Allowed (IPM):</b> Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3h Transitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved

Bit Range	Default & Access	Description
7:4	0h RW	<b>Speed Allowed (SPD):</b> Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	<b>Device Detection Initialization (DET):</b> Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

### 17.8.23 Port-Serial ATA Error (PxSERR0)—Offset 130h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSERR0:** [ABAR] + 130h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
DIAG				ERR				

Bit Range	Default & Access	Description
31:16	0000h RW/1C	<b>Diagnostics (DIAG):</b> Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PCS interrupt status bit and an interrupt will be generated if enabled.

Bit Range	Default & Access	Description
15:0	0000h RW/1C	<b>Error (ERR):</b> The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

## 17.8.24 Port-Serial ATA Active (PxSACT0)—Offset 134h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSACT0:** [ABAR] + 134h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:0	00000000h RW/1S	<b>Device Status (DS):</b> System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

## 17.8.25 Port-Commands Issued (PxCI0)—Offset 138h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxCIO:** [ABAR] + 138h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:0	00000000h RW	<b>Commands Issued (CI):</b> This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

## 17.8.26 Port-Device Sleep (PxDEVSLP0)—Offset 144h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxDEVSLP0:** [ABAR] + 144h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 1E022852h

31	28	24	20	16	12	8	4	0															
0	0	0	1	1	1	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1	0		
RSVD0				DM				DITO				MDAT				DETO				DSP		ADSE	

Bit Range	Default & Access	Description
31:29	0b RO	<b>RSVD0:</b> Reserved
28:25	Fh RW/O	<b>DITO Multiplier (DM):</b> 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	<b>DEVSLP Idle Timeout (DITO):</b> This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	<b>DEVSLP Minimum Assertion Time (MDAT):</b> This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	<b>DEVSLP Exit Timeout (DETO):</b> This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	<b>DEVSLP Present (DSP):</b> If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	<b>Aggressive DEVSLP Enable (ADSE):</b> When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

## 17.8.27 Port-Command List Base Address (PxCLB1)—Offset 180h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxCLB1:** [ABAR] + 180h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
CPDS	TFES	HBFS	HBDS	IFS	INFS	RSVD0	OFS	IPMS
								PRCS
RSVD1								
								DMPD
								PCS
								DPS
								UFS
								SDBS
								DSS
								PSS
								DHRS

Bit Range	Default & Access	Description
31	0h RO	<b>Cold Presence Detect Status (CPDS):</b> The SATA controller does not support cold presence detect.
30	0h RW/1C	<b>Task File Error Status (TFES):</b> This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	<b>Host Bus Fatal Error Status (HBFS):</b> Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	<b>Host Bus Data Error Status (HBDS):</b> Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	<b>Interface Fatal Error Status (IFS):</b> Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	<b>Interface Non-fatal Error Status (INFS):</b> Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	<b>RSVD0:</b> Reserved
24	0h RW/1C	<b>Overflow Status (OFS):</b> Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	<b>Incorrect Port Multiplier Status (IPMS):</b> Not supported
22	0h RO	<b>PhyRdy Change Status (PRCS):</b> When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	<b>RSVD1:</b> Reserved
7	0h RW/1C	<b>Device Mechanical Presence Status (DMPS):</b> When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	<b>Port Connect Change Status (PCS):</b> 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	<b>Descriptor Processed (DPS):</b> A PRD with the I. bit set has transferred all of its data.
4	0h RO	<b>Unknown FIS Interrupt (UFS):</b> When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	<b>Set Device Bits Interrupt (SDBS):</b> A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	<b>DMA Setup FIS Interrupt (DSS):</b> A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	<b>PIO Setup FIS Interrupt (PSS):</b> A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	<b>Device to Host Register FIS Interrupt (DHRS):</b> A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

## 17.8.32 Port-Interrupt Enable (PxIE1)—Offset 194h

Bit Range	Default & Access	Description
2	0h RW	<b>DMA Setup FIS Interrupt Enable (DSE):</b> When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	<b>PIO Setup FIS Interrupt Enable (PSE):</b> When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	<b>Device to Host Register FIS Interrupt Enable (DHRE):</b> When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

### 17.8.33 Port-Command (PxCMD1)—Offset 198h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxCMD1:** [ABAR] + 198h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000004h

31	28	24	20	16	12	8	4	0																
0	0	0	0	0	0	0	0	0																
0	0	0	0	0	0	0	0	0																
0	0	0	0	0	0	0	0	0																
ICC	ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD0	CR	FR	MPSS	CCS	RSVD1	PSP	APSE	FRE	CLO	POD	SUD	ST

Bit Range	Default & Access	Description
31:28	0h RW	<b>Interface Communication Control (ICC):</b> This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.

Bit Range	Default & Access	Description
27	0h RW	<b>Aggressive Slumber Partial (ASP):</b> When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleared to 0, software shall treat this bit as reserved.
26	0h RW	<b>Aggressive Link Power Management Enable (ALPE):</b> When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	<b>Drive LED on ATAPI Enable (DLAE):</b> When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	<b>Device is ATAPI (ATAPI):</b> When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	<b>Automatic Partial to Slumber Transitions Enabled (APSTE):</b> When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	<b>FIS-based Switching Capable Port (FBSCP):</b> The SATA controller does not support FIS-Based Switching.
21	0h RW/O	<b>External SATA Port (ESP):</b> When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.
20	0h RO	<b>Cold Presence Detection (CPD):</b> The SATA controller does not support cold presence detect.
19	0h RW/O	<b>Mechanical Presence Switch Attached to Port (MPSP):</b> If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	<b>Hot Plug Capable Port (HPCP):</b> This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	<b>Port Multiplier Attached (PMA):</b> Not supported
16	0b RO	<b>RSVD0:</b> Reserved
15	0h RO	<b>Command List Running (CR):</b> When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	<b>FIS Receive Running (FR):</b> When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	<b>Mechanical Presence Switch State (MPSS):</b> The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default & Access	Description
12:8	00h RO	<b>Current Command Slot (CCS):</b> Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	<b>RSVD1:</b> Reserved
6	0h RO	<b>PHYSLP Present (PSP):</b> If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.
5	0h RW	<b>Aggressive PHYSLP Enable (APSE):</b> This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	<b>FIS Receive Enable (FRE):</b> When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	<b>Command List Override (CLO):</b> Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	<b>Power On Device (POD):</b> The SATA controller does not support cold presence detect.
1	0h RW	<b>Spin-Up Device (SUD):</b> This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to 0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	<b>Start (ST):</b> When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

## 17.8.34 Port-Task File Data (PxTFD1)—Offset 1A0h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxTFD1:** [ABAR] + 1A0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 0000007Fh

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	1			
0	0	0	0	0	0	0	0	1			
RSVD0				ERR			STS_BSY	STS_RSVD0	STS_DRQ	STS_RSVD1	STS_ERR

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSVD0:</b> Reserved
15:8	00h RO	<b>Error (ERR):</b> Contains the latest copy of the task file error register.
7	0h RO	<b>Status Busy (STS_BSY):</b> Status - Indicates the interface is busy.
6:4	7h RO	<b>Status Rsvd0 (STS_RSVD0):</b> Status - Not Applicable.
3	1h RO	<b>Status Drq (STS_DRQ):</b> Status - Indicates a data transfer is requested.
2:1	3h RO	<b>Status Rsvd1 (STS_RSVD1):</b> Status - Not Applicable.
0	1h RO	<b>Status Err (STS_ERR):</b> Status - Indicates an error during the transfer.

## 17.8.35 Port-Signature (PxSIG1)—Offset 1A4h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSIG1:** [ABAR] + 1A4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
1	1	1	1	1	1	1	1	1
SIG								

Bit Range	Default & Access	Description
31:0	FFFFFFFh RO	<b>Signature (SIG):</b> Contains the signature received from a device on the first D2H Register FIS.

## 17.8.36 Port-Serial ATA Status (PxSSTS1)—Offset 1A8h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSSTS1:** [ABAR] + 1A8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVDO						IPM	SPD	DET

Bit Range	Default & Access	Description
31:12	0b RO	<b>RSVDO:</b> Reserved
11:8	0h RO	<b>Interface Power Management (IPM):</b> Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	<b>Current Interface Speed (SPD):</b> Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	<b>Device Detection (DET):</b> Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

### 17.8.37 Port-Serial ATA Control (PxSCTL1)—Offset 1ACh

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSCTL1:** [ABAR] + 1ACh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0			PMP	SPM	IPM	SPD	DET	

Bit Range	Default & Access	Description
31:20	0b RO	<b>RSVD0:</b> Reserved
19:16	0h RW	<b>Port Multiplier Port (PMP):</b> This field is not used by AHCI.
15:12	0h RW	<b>Select Power Management (SPM):</b> This field is not used by AHCI.
11:8	0h RW	<b>Interface Power Management Transitions Allowed (IPM):</b> Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3h Transitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved
7:4	0h RW	<b>Speed Allowed (SPD):</b> Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	<b>Device Detection Initialization (DET):</b> Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

### 17.8.38 Port-Serial ATA Error (PxSERR1)—Offset 1B0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSERR1:** [ABAR] + 1B0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
DIAG				ERR				

Bit Range	Default & Access	Description
31:16	0000h RW/1C	<p><b>Diagnostics (DIAG):</b> Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the POIS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCs interrupt status bit and an interrupt will be generated if enabled.</p>
15:0	0000h RW/1C	<p><b>Error (ERR):</b> The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.</p>

### 17.8.39 Port-Serial ATA Active (PxSACT1)—Offset 1B4h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSACT1:** [ABAR] + 1B4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
CI								

Bit Range	Default & Access	Description
31:0	00000000h RW	<b>Commands Issued (CI):</b> This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

### 17.8.41 Port-Device Sleep (PxDEVSLP1)—Offset 1C4h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxDEVSLP1:** [ABAR] + 1C4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 1E022852h

31	28	24	20	16	12	8	4	0																							
0	0	0	1	1	1	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	1	0	0	1	0	0	1	0	0	1	0
RSVD0				DM				DITO				MDAT				DETO				DSP	ADSE										

Bit Range	Default & Access	Description
31:29	0b RO	<b>RSVD0:</b> Reserved
28:25	Fh RW/O	<b>DITO Multiplier (DM):</b> 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	<b>DEVSLP Idle Timeout (DITO):</b> This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	<b>DEVSLP Minimum Assertion Time (MDAT):</b> This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	<b>DEVSLP Exit Timeout (DETO):</b> This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	<b>DEVSLP Present (DSP):</b> If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	<b>Aggressive DEVSLP Enable (ADSE):</b> When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLEP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

### 17.8.42 Enclosure Management Message Format (EM\_MF)—Offset 580h

This register is not implemented in VLV.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**EM\_MF:** [ABAR] + 580h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

RSVD																							

Bit Range	Default & Access	Description
31:0	0h RO	<b>RSVD:</b> Reserved.

### 17.8.43 Enclosure Management LED (EM\_LED)—Offset 584h

This register is not implemented in VLV.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**EM\_LED:** [ABAR] + 584h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	<b>RSVD:</b> Reserved.

## 17.9 SATA Primary Read Command IO Registers

**Table 197. Summary of SATA Primary Read Command I/O Registers—PCMDIDEBA**

Offset	Size	Register ID—Description	Default Value
1h	1	"Primary Channel Error register (P_ERROR)—Offset 1h" on page 2006	00h
2h	1	"Primary Channel Sector Count register (P_SECTOR_COUNT)—Offset 2h" on page 2006	00h
3h	1	"Primary Channel Sector Number register (P_SECTOR_NUMBER)—Offset 3h" on page 2007	00h
4h	1	"Primary Channel Cylinder Low register (P_CYL_LOW)—Offset 4h" on page 2008	00h
5h	1	"Primary Channel Cylinder High register (P_CYL_HIGH)—Offset 5h" on page 2008	00h
6h	1	"Primary Channel Device register (P_DRIVE_HEAD)—Offset 6h" on page 2009	00h
7h	1	"Primary Channel Status register (P_STATUS)—Offset 7h" on page 2009	00h

### 17.9.1 Primary Channel Error register (P\_ERROR)—Offset 1h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_ERROR:** [PCMDIDEBA] + 1h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Error (P_ERROR_1):</b> Error.

### 17.9.2 Primary Channel Sector Count register (P\_SECTOR\_COUNT)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_SECTOR\_COUNT:** [PCMDIDEBA] + 2h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Sector Count (P_SECTOR_COUNT_1):</b> Sector Count.

### 17.9.3 Primary Channel Sector Number register (P\_SECTOR\_NUMBER)—Offset 3h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_SECTOR\_NUMBER:** [PCMDIDEBA] + 3h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)  
**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Sector Number (P_SECTOR_NUMBER_1):</b> Sector Number.

## 17.9.4 Primary Channel Cylinder Low register (P\_CYL\_LOW)—Offset 4h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_CYL\_LOW:** [PCMDIDEBA] + 4h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Cylinder Low (P_CYL_LOW_1):</b> Cylinder Low.

## 17.9.5 Primary Channel Cylinder High register (P\_CYL\_HIGH)—Offset 5h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_CYL\_HIGH:** [PCMDIDEBA] + 5h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Cylinder High (P_CYL_HIGH_1):</b> Cylinder High.

## 17.9.6 Primary Channel Device register (P\_DRIVE\_HEAD)—Offset 6h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_DRIVE\_HEAD:** [PCMDIDEBA] + 6h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

7	0	0	0	4	0	0	0	0	0
RSVD0				P_DRIVE_HEAD_1	RSVD1				

Bit Range	Default & Access	Description
7:5	0b RO	<b>RSVD0:</b> Reserved
4	0h RW	<b>Device (P_DRIVE_HEAD_1):</b> Device.
3:0	0b RO	<b>RSVD1:</b> Reserved

## 17.9.7 Primary Channel Status register (P\_STATUS)—Offset 7h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_STATUS:** [PCMDIDEBA] + 7h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

7	0	0	0	4	0	0	0	0	0
P_STATUS_BSY	P_STATUS_DRDY	P_STATUS_DF	RSVD0	P_STATUS_DRQ	RSVD1		P_STATUS_ERR_CHK		

Bit Range	Default & Access	Description
7	0h RW	<b>BUSY (P_STATUS_BSY):</b> BUSY.

Bit Range	Default & Access	Description
6	0h RW	<b>Device Ready (P_STATUS_DRDY):</b> Device Ready.
5	0h RW	<b>Device Fault/Stream Error (P_STATUS_DF):</b> Device Fault/Stream Error.
4	0b RO	<b>RSVD0:</b> Reserved
3	0h RW	<b>Data Request (P_STATUS_DRQ):</b> Data Request.
2:1	0b RO	<b>RSVD1:</b> Reserved
0	0h RW	<b>ERR/CHK (P_STATUS_ERR_CHK):</b> ERR/CHK.

## 17.10 SATA Primary Write Control IO Registers

**Table 198. Summary of SATA Primary Write Control I/O Registers—PCTLIDEBA**

Offset	Size	Register ID—Description	Default Value
2h	1	"Primary Channel Device Control register (P_DEVICE_CTRL)—Offset 2h" on page 2011	00h

### 17.10.1 Primary Channel Device Control register (P\_DEVICE\_CTRL)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_DEVICE\_CTRL:** [PCTLIDEBA] + 2h

**PCTLIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCTLIDEBA Reference:** [B:0, D:19, F:0] + 104h

**Default:** 00h

7	4	0
0	0	0
RSVD0		RSVD1
P_DEVICE_CTRL_SRST		P_DEVICE_CTRL_nIEN

Bit Range	Default & Access	Description
7:3	0b RO	<b>RSVD0:</b> Reserved
2	0h RW	<b>Soft Reset (P_DEVICE_CTRL_SRST):</b> Soft Reset.
1	0h RW	<b>Interrupt Enable, Negative Logic (P_DEVICE_CTRL_nIEN):</b> Interrupt Enable, Negative Logic.
0	0b RO	<b>RSVD1:</b> Reserved

## 17.11 SATA Primary Read Control IO Registers

**Table 199. Summary of SATA Primary Read Control I/O Registers—PCTLIDEBA**

Offset	Size	Register ID—Description	Default Value
2h	1	"Primary Channel Alternate Status register (P_ALT_STATUS)—Offset 2h" on page 2012	00h

### 17.11.1 Primary Channel Alternate Status register (P\_ALT\_STATUS)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_ALT\_STATUS:** [PCTLIDEBA] + 2h

**PCTLIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCTLIDEBA Reference:** [B:0, D:19, F:0] + 104h

**Default:** 00h

7	0	0	0	4	0	0	0	0
P_ALT_STATUS_BSY	P_ALT_STATUS_DRDY	P_ALT_STATUS_DF	RSVD0	P_ALT_STATUS_DRQ	RSVD1			P_ALT_STATUS_ERR_CHK

Bit Range	Default & Access	Description
7	0h RW	<b>BUSY (P_ALT_STATUS_BSY):</b> BUSY.
6	0h RW	<b>Device Ready (P_ALT_STATUS_DRDY):</b> Device Ready.
5	0h RW	<b>Device Fault/Stream Error (P_ALT_STATUS_DF):</b> Device Fault/Stream Error.
4	0b RO	<b>RSVD0:</b> Reserved
3	0h RW	<b>Data Request (P_ALT_STATUS_DRQ):</b> Data Request.
2:1	0b RO	<b>RSVD1:</b> Reserved
0	0h RW	<b>ERR/CHK (P_ALT_STATUS_ERR_CHK):</b> ERR/CHK.

## 17.12 SATA Primary Write Control IO Registers

**Table 200. Summary of SATA Primary Write Control I/O Registers—PCTLIDEBA**

Offset	Size	Register ID—Description	Default Value
2h	1	"Primary Channel Device Control register (P_DEVICE_CTRL)—Offset 2h" on page 2013	00h

### 17.12.1 Primary Channel Device Control register (P\_DEVICE\_CTRL)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_DEVICE\_CTRL:** [PCTLIDEBA] + 2h

**PCTLIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCTLIDEBA Reference:** [B:0, D:19, F:0] + 104h

**Default:** 00h

7	4	0
0	0	0
RSVD0		RSVD1
P_DEVICE_CTRL_SRST		P_DEVICE_CTRL_nIEN

Bit Range	Default & Access	Description
7:3	0b RO	<b>RSVD0:</b> Reserved
2	0h RW	<b>Soft Reset (P_DEVICE_CTRL_SRST):</b> Soft Reset.
1	0h RW	<b>Interrupt Enable, Negative Logic (P_DEVICE_CTRL_nIEN):</b> Interrupt Enable, Negative Logic.
0	0b RO	<b>RSVD1:</b> Reserved

## 17.13 SATA Secondary Read Command IO Registers

**Table 201. Summary of SATA Secondary Read Command I/O Registers—SCMDIDEBA**

Offset	Size	Register ID—Description	Default Value
1h	1	"Secondary Channel Error register (S_ERROR)—Offset 1h" on page 2014	00h
2h	1	"Secondary Channel Sector Count register (S_SECTOR_COUNT)—Offset 2h" on page 2015	00h
3h	1	"Secondary Channel Sector Number register (S_SECTOR_NUMBER)—Offset 3h" on page 2015	00h
4h	1	"Secondary Channel Cylinder Low register (S_CYL_LOW)—Offset 4h" on page 2016	00h
5h	1	"Secondary Channel Cylinder High register (S_CYL_HIGH)—Offset 5h" on page 2016	00h
6h	1	"Secondary Channel Device register (S_DRIVE_HEAD)—Offset 6h" on page 2017	00h
7h	1	"Secondary Channel Status register (S_STATUS)—Offset 7h" on page 2018	00h

### 17.13.1 Secondary Channel Error register (S\_ERROR)—Offset 1h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_ERROR:** [SCMDIDEBA] + 1h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

7		4		0
0	0	0	0	0
S_ERROR_1				

Bit Range	Default & Access	Description
7:0	00h RW	<b>Error (S_ERROR_1):</b> Error.

### 17.13.2 Secondary Channel Sector Count register (S\_SECTOR\_COUNT)—Offset 2h

#### Access Method

Type: I/O Register  
(Size: 8 bits)

S\_SECTOR\_COUNT: [SCMDIDEBA] + 2h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)

SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RW	Sector Count (S_SECTOR_COUNT_1): Sector Count.

### 17.13.3 Secondary Channel Sector Number register (S\_SECTOR\_NUMBER)—Offset 3h

#### Access Method

Type: I/O Register  
(Size: 8 bits)

S\_SECTOR\_NUMBER: [SCMDIDEBA] + 3h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)

SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RW	Sector Number (S_SECTOR_NUMBER_1): Sector Number.

### 17.13.4 Secondary Channel Cylinder Low register (S\_CYL\_LOW)—Offset 4h

#### Access Method

Type: I/O Register  
(Size: 8 bits)

S\_CYL\_LOW: [SCMDIDEBA] + 4h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)

SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RW	Cylinder Low (S_CYL_LOW_1): Cylinder Low.

### 17.13.5 Secondary Channel Cylinder High register (S\_CYL\_HIGH)—Offset 5h

#### Access Method

Type: I/O Register  
(Size: 8 bits)

S\_CYL\_HIGH: [SCMDIDEBA] + 5h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)

SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RW	Cylinder High (S_CYL_HIGH_1): Cylinder High.

## 17.13.6 Secondary Channel Device register (S\_DRIVE\_HEAD)—Offset 6h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_DRIVE\_HEAD:** [SCMDIDEBA] + 6h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

7	0	0	0	4	0	0	0	0	0
RSVD0				S_DRIVE_HEAD_1	RSVD1				

Bit Range	Default & Access	Description
7:5	0b RO	<b>RSVD0:</b> Reserved
4	0h RW	<b>Device (S_DRIVE_HEAD_1):</b> Device.
3:0	0b RO	<b>RSVD1:</b> Reserved

## 17.13.7 Secondary Channel Status register (S\_STATUS)—Offset 7h

### Access Method

Type: I/O Register  
(Size: 8 bits)

S\_STATUS: [SCMDIDEBA] + 7h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)

SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h

7	0	0	0	4	0	0	0	0
S_STATUS_BSY	S_STATUS_DRDY	S_STATUS_DF	RSVD0	S_STATUS_DRQ	RSVD1			S_STATUS_ERR_CHK

Bit Range	Default & Access	Description
7	0h RW	<b>BUSY (S_STATUS_BSY):</b> BUSY.
6	0h RW	<b>Device Ready (S_STATUS_DRDY):</b> Device Ready.
5	0h RW	<b>Device Fault/Stream Error (S_STATUS_DF):</b> Device Fault/Stream Error.
4	0b RO	<b>RSVD0:</b> Reserved
3	0h RW	<b>Data Request (S_STATUS_DRQ):</b> Data Request.
2:1	0b RO	<b>RSVD1:</b> Reserved
0	0h RW	<b>ERR/CHK (S_STATUS_ERR_CHK):</b> ERR/CHK.

## 17.14 SATA Secondary Write Command IO Registers

**Table 202. Summary of SATA Secondary Write Command I/O Registers—SCMDIDEBA**

Offset	Size	Register ID—Description	Default Value
1h	1	“Secondary Channel Features register (S_FEATURES)—Offset 1h” on page 2019	00h
7h	1	“Secondary Channel Command register (S_COMMAND)—Offset 7h” on page 2020	00h

### 17.14.1 Secondary Channel Features register (S\_FEATURES)—Offset 1h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_FEATURES:** [SCMDIDEBA] + 1h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Features (S_FEATURES_1):</b> Features.

## 17.14.2 Secondary Channel Command register (S\_COMMAND)—Offset 7h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_COMMAND:** [SCMDIDEBA] + 7h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Command (S_COMMAND_1):</b> Command.

## 17.15 SATA Secondary Read Control IO Registers

**Table 203. Summary of SATA Secondary Read Control I/O Registers—SCTLIDEBA**

Offset	Size	Register ID—Description	Default Value
2h	1	"Secondary Channel Alternate Status register (S_ALT_STATUS)—Offset 2h" on page 2021	00h

### 17.15.1 Secondary Channel Alternate Status register (S\_ALT\_STATUS)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_ALT\_STATUS:** [SCTLIDEBA] + 2h

**SCTLIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCTLIDEBA Reference:** [B:0, D:19, F:0] + 108h

**Default:** 00h

7				4				0
0	0	0	0	0	0	0	0	0
S_ALT_STATUS_BSY	S_ALT_STATUS_DRDY	S_ALT_STATUS_DF	RSVD0	S_ALT_STATUS_DRQ	RSVD1			S_ALT_STATUS_ERR_CHK

Bit Range	Default & Access	Description
7	0h RW	<b>BUSY (S_ALT_STATUS_BSY):</b> BUSY.
6	0h RW	<b>Device Ready (S_ALT_STATUS_DRDY):</b> Device Ready.
5	0h RW	<b>Device Fault/Stream Error (S_ALT_STATUS_DF):</b> Device Fault/Stream Error.
4	0b RO	<b>RSVD0:</b> Reserved
3	0h RW	<b>Data Request (S_ALT_STATUS_DRQ):</b> Data Request.
2:1	0b RO	<b>RSVD1:</b> Reserved
0	0h RW	<b>ERR/CHK (S_ALT_STATUS_ERR_CHK):</b> ERR/CHK.

## 17.16 SATA Secondary Write Command IO Registers

**Table 204. Summary of SATA Secondary Write Command I/O Registers—SCMDIDEBA**

Offset	Size	Register ID—Description	Default Value
1h	1	"Secondary Channel Features register (S_FEATURES)—Offset 1h" on page 2022	00h
7h	1	"Secondary Channel Command register (S_COMMAND)—Offset 7h" on page 2023	00h

### 17.16.1 Secondary Channel Features register (S\_FEATURES)—Offset 1h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_FEATURES:** [SCMDIDEBA] + 1h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

7	4	0
0	0	0
S_FEATURES_1		
Bit Range	Default & Access	Description
7:0	00h RW	<b>Features (S_FEATURES_1):</b> Features.

## 17.16.2 Secondary Channel Command register (S\_COMMAND)—Offset 7h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_COMMAND:** [SCMDIDEBA] + 7h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

Bit Range	Default & Access	Description
7:0	00h RW	<b>Command (S_COMMAND_1):</b> Command.

## 17.17 SATA Lane 0 Electrical Register Address Map

**Table 205. Summary of SATA Lane 0 Electrical Message Bus Registers—0xA3 (Global Offset 2200h)**

Offset	Register ID—Description	Default Value
0h	"PCS_DWORD0 (pcs_dword0)—Offset 0h" on page 2026	00010080h

60h	"PCS_DWORD24 (pcs_dword24)—Offset 60h" on page 2053	0001C020h

## 17.17.1 PCS\_DWORD0 (pcs\_dword0)—Offset 0h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword0:** [Port: 0xA3] + (2200h + 0h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 00010080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	1	0	0	0
reg_txcfgchange_valid_delay_3_0	reg_txcfgchange_rst_delay_3_0	reserved500	reg_txcfgchange_width_4_0	reg_txcfgchange_override	reg_tx2_soft_reset_n	reg_txswing_clkssel	reg_rcvdetect_ovrd	reg_rcvdetect
							reg_rcvdetect_pulse_width_ovrd	reg_rcvdetect_pulse_width_2_0
							reg_tx1_soft_reset_n	reg_tx_8b10b_bypass
							reg_tx_laneup	reg_left_txififo_rst_master2
							reg_right_txififo_rst_master2	reg_plllinksynch_ovrden
							reg_plllinksynch_ovrd	reg_tx1_cmmdisparity

Bit Range	Default & Access	Description
31:28	0h RW	<b>reg_txcfgchange_valid_delay_3_0:</b> Controls counter to wait 128ns after txcfgchange asserts when coming out of reset. This will control phystatus de-assertion after reset. Note: Minimum value when programmed has to be 4'b0100 or greater.
27:24	0h RW	<b>reg_txcfgchange_rst_delay_3_0:</b> Counter value to delay txcfgchange toggle after coming out of reset.
23	0h RW	<b>reserved500:</b> reserved
22:18	0h RW	<b>reg_txcfgchange_width_4_0:</b> Tx power fsm output - divider ratio
17	0h RW	<b>reg_txcfgchange_override:</b> Override txchfchange related counters. (reg_txcfgchange_width, reg_txcfgchange_valid_delay, reg_txcfgchange_rst_delay)
16	1h RW	<b>reg_tx2_soft_reset_n:</b> Active low reset to independently reset Tx lane2 in Display Port
15	0h RW	<b>reg_txswing_clkssel:</b> When 0 selects divide by 2 version of the ick_pllclk clock for Tx swing control logic When 1 selects ick_pllclk clock for Tx swing control logic.
14	0h RW	<b>reg_rcvdetect_ovrd_____:</b> override enable for rcvdetect and rcvdetectfinished
13	0h RW	<b>reg_rcvdetect_____:</b> override for rcvdetect
12	0h RW	<b>reg_rcvdetectfinished_____:</b> override for rcvdetectfinished

Bit Range	Default & Access	Description
11	0h RW	<b>reg_rcvdetect_pulse_width_ovrd:</b> override enable for rcvdetect_pulse_width
10:8	0h RW	<b>reg_rcvdetect_pulse_width_2_0:</b> override value for rcvdetect_pulse_width
7	1h RW	<b>reg_tx1_soft_reset_n:</b> Active low reset to independently reset Tx lane1 in Display Port 0: Lane 1 reset 1: Lane 1 active
6	0h RW	<b>reg_tx_8b10b_bypass:</b> Bypass 8b10b encoder ( for SAPIS etc interface.) 0 = Disable 8b/10b encoder bypass 1 = Enable 8b/10b encoder bypass
5	0h RW	<b>reg_tx_laneup:</b> Unused in Tx
4	0h RW	<b>reg_left_txfifo_rst_master2:</b> override enable = reg_lanedeskew_strap_ovrd
3	0h RW	<b>reg_right_txfifo_rst_master2:</b> override enable = reg_lanedeskew_strap_ovrd
2	0h RW	<b>reg_plllinksynch_ovrden:</b> Override enable for reg_pllinsynch_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	<b>reg_plllinksynch_ovrd:</b> override value for plllinksynch
0	0h RW	<b>reg_tx1_cmmdisparity:</b> Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

Bit Range	Default & Access	Description
5	1h RW	<b>soft_reset_n</b> : Active low soft reset override
4	0h RW	<b>reg_diginelben</b> : Override for near end digital loopback.
3	0h RW	<b>reg_digifelben</b> : Override for far end digital loopback
2	0h RW	<b>reg_strapgroup_ovrden</b> : Override Enable for Strap Group
1	0h RW	<b>reg_yank_timer_done_b_ovrd</b> : Override for yank_timer_done_b
0	0h RW	<b>reg_yank_timer_done_b_ovrd_en</b> : Override Enable for yank_timer_done_b

### 17.17.3 PCS\_DWORD2 (pcs\_dword2)—Offset 8h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword2:** [Port: 0xA3] + (2200h + 8h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reg_rxpwrfsm_pibiasoff_delay_3_0	cri_sqdbexittimer_override_3_0	cri_sqdbentrytimer_override_5_0	reg_rxdrcgtsqsel_1_0	cri_reut_SlaveSideDataCheckingEn	cri_sqdbtimer_ovren	cri_rxpwrfsm_timer_ovren	reg_rxidtle	cri_rxrawdata_sel
				cri_dynkalign_eco3302703_mode	cri_dynkalign_eco3302703_ovren	reg_rxpwrfsm_pibiasoff_ovrride	cri_reset_kalignck	cri_ebptrrst
				cri_comdispfix	cri_forcebankhit	cri_kalignmode_1_0	cri_skpprocdis	cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	<b>reg_rxpwrfsm_pibiasoff_delay_3_0</b> : Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	<b>cri_sqdbexittimer_override_3_0</b> : Rx squelch exit debounce timer
23:18	0h RW	<b>cri_sqdbentrytimer_override_5_0</b> : Rx squelch entry debounce timer
17:16	0h RW	<b>reg_rxdrcgtsqsel_1_0</b> : Squelch output select

Bit Range	Default & Access	Description
15	0h RW	<b>cri_reut_SlaveSideDataCheckingEn:</b> Enable REUT slave side checking while in loopback slave
14	0h RW	<b>cri_sqdbtimer_ovren:</b> Squelch debounce timer override enable
13	0h RW	<b>cri_rxpwrfsm_timer_ovren:</b> Rx power management fsm timer override enable
12	0h RW	<b>reg_rxidle:</b> Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	<b>cri_rxrawdata_sel:</b> When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	<b>cri_dynkalign_eco3302703_mode:</b> Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	<b>cri_dynkalign_eco3302703_ovren:</b> Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	<b>reg_rxpwrfsm_pibiasoff_override:</b> When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	<b>cri_reset_kalignlck:</b> When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	<b>cri_ebptrrst:</b> Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	<b>cri_comdispfix:</b> Chicken bit to force disparity in dynamic K-align mode
4	0h RW	<b>cri_forcebankhit:</b> Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	<b>cri_kalignmode_1_0:</b> KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	<b>cri_skpprocdis:</b> SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	<b>cri_elasticbuffer_maskdis:</b> Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

#### 17.17.4 PCS\_DWORD3 (pcs\_dword3)—Offset Ch

##### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword3:** [Port: 0xA3] + (2200h + Ch)

##### Op Codes:

0h - Read, 1h - Write

**Default:** 5515ACAAh

27	0h RW	<b>reserved520:</b> reserved
26	0h RW	<b>i_rxsqfsm_timersel:</b> Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.

Bit Range	Default & Access	Description
25	0h RW	<b>i_rxsq_asyncmode_h</b> : Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	<b>i_rxsquelchstby_h</b> : Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

reserved528				reserved527	cri_lanereset_clkgatecti	cri_lanereqforce	cri_susclkdisable_delay_4_0	cri_data_dynclkgate_mode_1_0	cri_eios_waittime_ovren	cri_eios_waittime_6_0

Bit Range	Default & Access	Description
31:24	0h RW	<b>reserved528:</b> reserved
23:17	0h RW	<b>reserved527:</b> reserved
16	1h RW	<b>cri_lanereset_clkgatecti:</b> 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	<b>cri_lanereqforce:</b> Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	<b>cri_susclkdisable_delay_4_0:</b> This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay ..... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	<b>cri_data_dynclkgate_mode_1_0:</b> Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.
7	0h RW	<b>cri_eios_waittime_ovren:</b> EIOS Wait Time Override Enable for Rx Turn OFF 0: hardware value for EIOS wait timer is selected. 1: selects cri_eios_waittime[6:0]
6:0	20h RW	<b>cri_eios_waittime_6_0:</b> EIOS Wait Time for Rx Turn OFF Represents override value timer in PCS that comes into play during EIOS based turn off Rx (Rx L0s) 0000000 - Timer is bypassed 0000001 - 1 PLL link clock period delay (2ns) 0000010 - 2 PLL link clock period delay (4ns) ... 0100000 - 32 PLL link clock periods delay (64ns) - default

### 17.19.1 PCS\_DWORD0 (pcs\_dword0)—Offset 0h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword0:** [Port: 0xA3] + (2400h + 0h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00010080h

Bit Range	Default & Access	Description
5	0h RW	<b>reg_tx_laneup:</b> Unused in Tx
4	0h RW	<b>reg_left_txfifo_rst_master2:</b> override enable = reg_lanedeskew_strap_ovrd
3	0h RW	<b>reg_right_txfifo_rst_master2:</b> override enable = reg_lanedeskew_strap_ovrd
2	0h RW	<b>reg_plllinksynch_ovrden:</b> Override enable for reg_pllinsync_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	<b>reg_plllinksynch_ovrd:</b> override value for plllinksynch
0	0h RW	<b>reg_tx1_cmmdisparity:</b> Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

## 17.19.2 PCS\_DWORD1 (pcs\_dword1)—Offset 4h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword1:** [Port: 0xA3] + (2400h + 4h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 00600060h

31	28	24	20	16	12	8	4	0									
0	0	0	0	0	0	0	0	0									
0	0	0	0	0	0	0	0	0									
reg_txfs_m_4us_delay_7_0		reg_softreset_enable	cri_rxeb_eiosenable	cri_rxdigifltsq_enable	reg_txfs_m_delay_ovrd	reg_txfs_m_4us_delay_11_8	reg_pcik_rate_1_0	reg_rate_1_0	reg_phymode_2_0	reg_modeovren	reg_datawidth	soft_reset_n	reg_diginelben	reg_digifelben	reg_strapgroup_ovrden	reg_yank_timer_done_b_ovrd	reg_yank_timer_done_b_ovrd_en

Bit Range	Default & Access	Description
31:24	0h RW	<b>reg_txfs_m_4us_delay_7_0:</b> Override counter value for 4 us delay in txfs_m lane reset to txbiasen delay
23	0h RW	<b>reg_softreset_enable:</b> When '1' the soft_reset_n bit will control the lane reset When '0' the hardware reset will control the lane reset Note for DP: In addition to soft_reset_n, which will reset both TX0 and TX 1 in the lane, the reg_tx1_soft_reset_n bit can be used to reset only TX1 in the lane and reg_tx2_soft_reset_n bit can be used to reset only TX2
22	1h RW	<b>cri_rxeb_eiosenable:</b> When 1 enables EIOS based Rx power down

Bit Range	Default & Access	Description
21	1h RW	<b>cri_rxdigfiltsq_enable:</b> When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	<b>reg_txfsm_delay_ovrd:</b> Override enable bit for reg_txfsm_4us_delay
19:16	0h RW	<b>reg_txfsm_4us_delay_11_8:</b> Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
15:14	0h RW	<b>reg_pclk_rate_1_0:</b> Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	<b>reg_rate_1_0:</b> Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	<b>reg_phymode_2_0:</b> Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	<b>reg_modeovren:</b> When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	<b>reg_datawidth:</b> Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default ) 10 - x16/x20 width 11 - x32/x40 width
5	1h RW	<b>soft_reset_n:</b> Active low soft reset override
4	0h RW	<b>reg_diginelben:</b> Override for near end digital loopback.
3	0h RW	<b>reg_digifelben:</b> Override for far end digital loopback
2	0h RW	<b>reg_strapgroup_ovrden:</b> Override Enable for Strap Group
1	0h RW	<b>reg_yank_timer_done_b_ovrd:</b> Override for yank_timer_done_b
0	0h RW	<b>reg_yank_timer_done_b_ovrd_en:</b> Override Enable for yank_timer_done_b

### 17.19.3 PCS\_DWORD2 (pcs\_dword2)—Offset 8h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword2:** [Port: 0xA3] + (2400h + 8h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0

								cri_ebptrrst
								cri_comdispfix
								cri_forcebankhit
								cri_kalignmode_1_0
								cri_skpprocdis
								cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	<b>reg_rxpwrfsm_pibiasoff_delay_3_0:</b> Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	<b>cri_sqdbexittimer_override_3_0:</b> Rx squelch exit debounce timer
23:18	0h RW	<b>cri_sqdbentrytimer_override_5_0:</b> Rx squelch entry debounce timer
17:16	0h RW	<b>reg_rxdrcgtsqsel_1_0:</b> Squelch output select
15	0h RW	<b>cri_reut_SlaveSideDataCheckingEn:</b> Enable REUT slave side checking while in loopback slave
14	0h RW	<b>cri_sqdbtimer_ovren:</b> Squelch debounce timer override enable
13	0h RW	<b>cri_rxpwrfsm_timer_ovren:</b> Rx power management fsm timer override enable
12	0h RW	<b>reg_rxidle:</b> Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	<b>cri_rxrawdata_sel:</b> When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	<b>cri_dynkalign_eco3302703_mode:</b> Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	<b>cri_dynkalign_eco3302703_ovren:</b> Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	<b>reg_rxpwrfsm_pibiasoff_ovrride:</b> When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	<b>cri_reset_kalignlck:</b> When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	<b>cri_ebptrrst:</b> Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	<b>cri_comdispfix:</b> Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	<b>cri_forcebankhit:</b> Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	<b>cri_kalignmode_1_0:</b> KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	<b>cri_skpprocdis:</b> SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	<b>cri_elasticbuffer_maskdis:</b> Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

## 17.19.4 PCS\_DWORD3 (pcs\_dword3)—Offset Ch

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword3:** [Port: 0xA3] + (2400h + Ch)

## 17.19.6 PCS\_DWORD5 (pcs\_dword5)—Offset 14h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword5:** [Port: 0xA3] + (2400h + 14h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 00003E63h

31	28	24	20	16	12	8	4	0																									
0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1	1	0	0	0	1	1										
cri_dfx_patbuftrain		cri_dfx_prbspoly_2_0		cri_dfx_patbufsize_1_0		cri_dfx_patbufloop		cri_dfx_patbufwidth		cri_dfx_patbuftrainovr		cri_dfx_marginmode		cri_dfx_chk_sel		cri_dfx_patchken		cri_dfx_patgenen		cri_dfx_clrerrcnt		cri_dfx_lcereset		cri_dfx_lcestart		cri_dfx_patbuf_7_0				cri_dfx_patbuf_15_8			

Bit Range	Default & Access	Description
31	0h RW	<b>cri_dfx_patbuftrain:</b> Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	<b>cri_dfx_prbspoly_2_0:</b> PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - $x^{16} + x^5 + x^4 + x^3 + 1$ (USB3/PCIe Scrambler) (8b) 001 - $x^{16} + x^{15} + x^{13} + x^4 + 1$ (SATA scrambler) (8b) 010 - $x^{31} + x^{28} + 1$ (8b) 011 - $x^7 + x^6 + 1$ (8b) 100 - $x^{15} + x^{14} + 1$ (10b) 101 - $x^{23} + x^{18} + 1$ (10b) 110 - $x^{31} + x^{28} + 1$ (10b) 111 - $x^7 + x^6 + 1$ (10b)
27:26	0h RW	<b>cri_dfx_patbufsize_1_0:</b> Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCEDATAWIDTH (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	<b>cri_dfx_patbufloop:</b> Pattern Buffer Looping Enable Enables looping of the Pattern Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	<b>cri_dfx_patbufwidth:</b> Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	<b>cri_dfx_patbuftrainovr:</b> Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Pattern Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	<b>cri_dfx_marginmode:</b> Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	<b>cri_dfx_chk_sel:</b> Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-)8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	<b>cri_dfx_patchken:</b> Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	<b>cri_dfx_patgenen:</b> Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	<b>cri_dfx_clrerrcnt:</b> Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	<b>cri_dfx_lcereset:</b> Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	<b>cri_dfx_lcestart:</b> Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	<b>cri_dfx_patbuf_7_0:</b> Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	<b>cri_dfx_patbuf_15_8:</b> Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

## 17.19.7 PCS\_DWORD6 (pcs\_dword6)—Offset 18h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword6:** [Port: 0xA3] + (2400h + 18h)

### Op Codes:

0h - Read, 1h - Write

**Default:** FFFFFFFFh

31	28	24	20	16	12	8	4	0							
1	1	1	1	1	1	1	1	1							
cri_dfx_prbseed_7_0				cri_dfx_prbseed_15_8				cri_dfx_prbseed_23_16				cri_dfx_prbseed_31_24			

Bit Range	Default & Access	Description
31:24	FFh RW	<b>cri_dfx_prbseed_7_0:</b> PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	<b>cri_dfx_prbseed_15_8:</b> PRBS Seed See cri_dfx_prbseed[7:0] description.
15:8	FFh RW	<b>cri_dfx_prbseed_23_16:</b> PRBS Seed See cri_dfx_prbseed[7:0] description.
7:0	FFh RW	<b>cri_dfx_prbseed_31_24:</b> PRBS Seed See cri_dfx_prbseed[7:0] description.

## 17.19.8 PCS\_DWORD7 (pcs\_dword7)—Offset 1Ch

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword7:** [Port: 0xA3] + (2400h + 1Ch)

### Op Codes:

0h - Read, 1h - Write

**Default:** 00000009h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	1			
dfx_cri_errcnt_7_0				dfx_cri_errcnt_15_8				cri_dfx_prbstraincnt_3_0			
				i_rxcaldone							
				dfx_cri_lcemgnerr							
				cri_dfx_patgen2active							
				dfx_cri_patbufallfail							
				dfx_cri_patchkactive							
				dfx_cri_patgenactive							
				dfx_cri_lcetraindone							
				dfx_cri_lcetraininactive							
				reserved501							
				cri_dfx_patgen2en							
				cri_dfx_maxerrcnt_1_0							

Bit Range	Default & Access	Description
31:24	X RO	<b>dfx_cri_errcnt_7_0:</b> Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
23:16	X RO	<b>dfx_cri_errcnt_15_8:</b> Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
15	X RO	<b>i_rxcaldone:</b> RX Calibration Cycles Complete Indicator
14	X RO	<b>dfx_cri_lcemgnerr:</b> Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	<b>cri_dfx_patgen2active:</b> Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	<b>dfx_cri_patbufallfail:</b> Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occurred during training.
11	X RO	<b>dfx_cri_patchkactive:</b> Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	<b>dfx_cri_patgenactive:</b> Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	<b>dfx_cri_lcetraindone:</b> Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	<b>dfx_cri_lcetrainactive:</b> Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	<b>reserved501:</b> reserved
6	0h RW	<b>cri_dfx_patgen2en:</b> Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	<b>cri_dfx_maxerrcnt_1_0:</b> Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2 <sup>16</sup> (default) 01 : 2 <sup>10</sup> 10 : 2 <sup>8</sup> 11 : 2 <sup>4</sup>
3:0	9h RW	<b>cri_dfx_prbstraincnt_3_0:</b> PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

### 17.19.9 PCS\_DWORDS8 (pcs\_dword8)—Offset 20h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword8:** [Port: 0xA3] + (2400h + 20h)

30:28	0h RW	<b>sqelch_shunt_cnt_2_0:</b> Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	<b>reserved520:</b> reserved
26	0h RW	<b>i_rxsqfsm_timersel:</b> Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	<b>i_rxsq_asyncmode_h:</b> Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	<b>i_rxsqelchstby_h:</b> Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

### 17.20.3 TX\_DWORD2 (tx\_dword2)—Offset 8h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword2:** [Port: 0xA3] + (2480h + 8h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 5580983Ah

31	28	24	20	16	12	8	4	0
0	1	0	1	0	0	1	0	1
0	1	0	1	1	0	0	0	0
0	1	0	0	0	0	0	1	1
0	1	0	1	0	0	0	0	0
omargin010_7_0			omargin000_7_0		ouniqtranscale_7_0	reserved511		ofrcslices_6_0

Bit Range	Default & Access	Description
31:24	55h RW	<b>omargin010_7_0:</b> factor (X/128) of slices to use in main-R1 for full swing level. Used for ~2/3Vp2p
23:16	80h RW	<b>omargin000_7_0:</b> factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p. To be used in Gen2 mode (Gen1/Gen2 depend on dataratefit and downscaleamp register)
15:8	98h RW	<b>ouniqtranscale_7_0:</b> scales the number of slices defined the ref circuit (or R-comp circuit) by factor of ouniqtranscale[7:0]/128 The scaled amount of slices might be used in the full-swing Uis according to ouniqtrangenmethod[1:0] The scaled amount of slices might be used in the full-swing Uis according to oscaledcompmethod[1:0]
7	0h RO	<b>reserved511:</b> reserved
6:0	3Ah RW	<b>ofrcslices_6_0:</b> number of used slices if forced Used in compensated GPIO mode

### 17.20.4 TX\_DWORD3 (tx\_dword3)—Offset Ch

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword3:** [Port: 0xA3] + (2480h + Ch)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 0C782040h

31	28	24	20	16	12	8	4	0
0	0 0 0 0	1 1 0 0	0 1 1 1	1 0 0 0	0 0 1 0	0 0 0 0	0 1 0 0	0 0 0 0
opisorate8b_h	obeacondivratio	ouniqetrangenmethod_1_0	oscaledcompmethod_1_0	odeemswinggenmethod	odownscaleampmethod	omargin101_7_0	omargin100_7_0	omargin011_7_0

Bit Range	Default & Access	Description
31	0h RW	<b>opisorate8b_h:</b> if '0' the PISO is of 10 bits (the whole bus) if '1' the PISO is of 8 bits (The LSBs) It's relevant both in normal Tx and in loopback mode. Use: '1' in PCI-E gen 3 and CIO (if supported) '0' for all other interfaces
30	0h RW	<b>obeacondivratio:</b> Div ration of beacon signal from ick_suslow clock '0' - Beacon freq will be as sus clock freq '1' - Beacon freq will be 1/4 of sus clock freq (note LFPS spec is 10-50MHz)
29:28	0h RW	<b>ouniqetrangenmethod_1_0:</b> Used to define if we use uniq-transition-bit scaling or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't activate uniq-transition-bit When '01' - if fast-clock is not divided (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. When '10' - if fast-clock is not divided or divided by 2 (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. (will probably be down-scaling amount of slices) When '11' - activate uniq-transition-bit
27:26	3h RW	<b>oscaledcompmethod_1_0:</b> Used to define if we use scaling of the compansation values or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't used scaled comp When '01' - if fast-clock is not divided (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp When '10' - if fast-clock is not divided or divided by 2 (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp (will probably be down-scaling amount of slices) When '11' - if fast-clock is not divided (gen2?) use scaled-comp otherwise (gen1?) don't use scaled-comp (will probably be up-scaling amount of slices)
25	0h RW	<b>odeemswinggenmethod:</b> Used to select scaling of -3.5dB deemphasis either ow2tapgen1deemph3p5[7:0] or ow2tapgen2deemph3p5[7:0] When '0' - if fast-clock is not divided use gen2 otherwise use gen1 When '1' - if fast-clock is not divided or divided by 2 use gen2 otherwise use gen1
24	0h RW	<b>odownscaleampmethod:</b> when margin='001', this bit with dataratefit are used to select between margin000 (for gen2) and margin101 (for gen1) when '0' - if fast-clock is not divided use margin000 (gen2) otherwise use margin101 (gen1) when '1' - if fast-clock is not divided or divided by 2 use margin000 (gen2) otherwise use margin101 (gen1)
23:16	78h RW	<b>omargin101_7_0:</b> factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p to be used in Gen1 mode (Gen1/Gen2 depends on dataratefit and downscaleamp register)
15:8	20h RW	<b>omargin100_7_0:</b> factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/4Vp2p
7:0	40h RW	<b>omargin011_7_0:</b> factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/2Vp2p

## 17.20.5 TX\_DWORD4 (tx\_dword4)—Offset 10h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword4:** [Port: 0xA3] + (2480h + 10h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 2B404D55h

31	28	24	20	16	12	8	4	0
0	0	1	0	1	0	1	1	1
0	0	1	0	1	1	0	1	0

## 17.20.7 TX\_DWORD6 (tx\_dword6)—Offset 18h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword6:** [Port: 0xA3] + (2480h + 18h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 1F200000h

31	28	24	20	16	12	8	4	0	
0	0	0	1	1	1	1	0	0	
reserved520	onswbypass_6_0		reserved519	opswbypass_6_0		reserved518	reserved517	ocalcont	reserved516

Bit Range	Default & Access	Description
31	0h RO	<b>reserved520:</b> reserved

Bit Range	Default & Access	Description
30:24	1Fh RW	<b>onswbypass_6_0</b> : Determines # of slices activated in N-drv when in strong pulling to CM (after Rx-dtct/ gohighz / stongPD) same slices cannot be opend for P-drv and for N-drv. Determines # of slices for P-drv in All1/All0 DFTs when bypbycomp is not asserted. In these DFT modes pswpass can be set to the same value as nswbypass
23	0h RO	<b>reserved519</b> : reserved
22:16	20h RW	<b>opswbypass_6_0</b> : Determines # of slices activated in P-drv when in strong pulling to CM (after Rx-dtct/ gohighz / stongPD) Determines # of slices for P-drv in All1/All0 DFTs when bypbycomp is not asserted.
15	0h RO	<b>reserved518</b> : reserved
14:8	0h RO	<b>reserved517</b> : reserved
7	0h RW	<b>ocalcont</b> : initiate calculation of swing-cotrol circuit. While this signal is '1' the calculation is beeing done consecutively
6:0	0h RO	<b>reserved516</b> : reserved

## 17.20.8 TX\_DWORD7 (tx\_dword7)—Offset 1Ch

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword7:** [Port: 0xA3] + (2480h + 1Ch)

### Op Codes:

0h - Read, 1h - Write

**Default:** 0038383Fh

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1	1	1	1

# 18 USB Host Controller Interfaces (xHCI, EHCI)

The USB Host Controllers (xHCI, EHCI) supports:

- One (1) Super Speed (SS) port on xHCI
- Four (4) Low Speed (LS)/Full Speed (FS)/High Speed (HS) ports on xHCI or EHCI
- Two (2) High Speed (HS) High Speed Inter-Chip (HSIC) ports on xHCI

**Note:** The SS port must share a LS/FS/HS port to have a full SS connector leaving three LS/FS/HS ports available.

**Note:** Only one host controller (either xHCI or EHCI) can be used. To enable HSIC and SS ports, xHCI must be used.

## 18.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 209. USB 3 SS Signals

Signal Name	Direction Plat Power	Description
USB3_TXP/N[0]	O V1P0A	<b>Data Out:</b> High speed serialized data outputs. Used for debug mode in xHCI operation.
USB3_RXP/N[0]	I V1P0A	<b>Data In:</b> High speed serialized data inputs. Used for debug mode in xHCI operation.
USB3_REXT[0]	I	<b>Resistor Compensation:</b> An external resistor must be connected between this pin and package ground. Contact your Intel representative for details.

Table 210. USB 2 FS/HS Signals

Signal Name	Direction Plat. Power	Description
USB_DP/N[0:3]	I/O VUSB2	<b>USB Data:</b> High speed serialized data I/O.  <b>Note:</b> USB_DP/N[1] used for debug mode in EHCI operation only. SS port must be implemented to have debug mode during xHCI operation.
USB_OC[0:1]#	I V1P8A	<b>Over-Current Protection:</b> Over-current notification for all USB ports (SS/FS/HS/LS).
USB_RCOMPI	I	<b>Resistor Compensation:</b> An external resistor must be connected. Contact your Intel representative for details.
USB_RCOMPO	O	<b>Resistor Compensation:</b> An external resistor must be connected. Contact your Intel representative for details.

Table 211. USB 2 HSIC Signals

Signal Name	Direction Plat. Power	Description
USB_HSIC[0:1]_DATA	I/O V1P24A	<b>HSIC Data:</b> High speed serialized data.
USB_HSIC[0:1]_STROBE	I/O V1P24A	<b>HSIC Strobe:</b> Strobe reference for data.
USB_HSIC_RCOMP	I	<b>Resistor Compensation:</b> An external resistor must be connected. Contact your Intel representative for details.

Figure 103.xHCI and EHCI Port Mapping

**Note:** xHCI (3.0) SS is the debug port for xHCI controller.  
**Note:** EHCI (1/2.0) Port 1 is the debug port of the EHCI controller

## 18.2 USB 3.0 xHCI (Extensible Host Controller Interface)

The xHCI compliant host controller can control up to 7 USB host ports. It supports devices conforming to USB 1.x to 3.0 at bit rates up to 5 Gbps.

### 18.2.1 Features of USB 3.0 Host

The USB 3.0 Super Speed data interface is a four wire differential (TX and RX pairs) interface that supports simultaneous bi-directional data transmission. The interface supports a bit rate of 5 Gbps with a maximum theoretical data throughput over 3.2 Gbps due to 8b/10b symbol encoding scheme and protocol overhead (link flow control, packet framing and protocol overhead).

Low Frequency Periodic signaling (LFPS) is used to communicate initialization, training and power management information across a link that is in low power link state without using Super Speed signaling. This reduces power consumption.

The USB3.0 port may be paired with any USB2 port at the connector – selection of any USB2 port other than port 0 will require the appropriate mapping. Figure 103 shows the USB3 port paired with USB2 port 0.

#### USB3.0 Controller Features

- Supported by xHCI software host controller interface
- USB3 port disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 3.0 LPM (U0, U1, U2, and U3) and also a SS Disabled low power state

- Support for USB3 Debug Device

**Note:** Recommended not to disconnect the connection when a debug session is in progress.

## 18.2.2 Features of USB HSIC

HSIC is a 2-signal (strobe and data) source synchronous serial interface for on board inter-chip USB communication. The interface uses 240 MHz DDR signaling to provide High-Speed 480 Mb/s USB transfers which are 100% host driver compatible with traditional USB cable connected topologies. Full Speed (FS) and Low Speed (LS) USB transfers are not directly supported by the HSIC interface.

For details of HSIC applications supported, Contact local Intel Sales office.

Major feature and performance highlights are as follows:

- Supported by xHCI software host controller interface
- High-Speed 480 Mb/s data rate only
- Source-synchronous serial interface
- Interface Power is only consumed when a transfer is in progress
- No hot plug removal/attach at HSIC pins
- Signals driven at 1.2V standard LVCMOS levels
- Designed for low power applications
- Support for two host ports compliant to High Speed Inter-Chip Supplement (HSIC) to the USB 2.0 Specification. (USB 2.0)

## 18.3 USB 2.0 Enhanced Host Controller Interface (EHCI)

The EHCI compliant host controller supports up to 4 USB 2.0 ports in legacy mode. USB 2.0 allows data transfers up to 480 Mbps. The controller integrates a Root Matching Hub (RMH) to support USB 1.1 devices.

**Note:** The EHCI is not used when the xHCI is used. The EHCI is primarily present for legacy usage, in cases when xHCI support is not available.

**Note:** Intel recommends using the xHCI controller for the USB2.0 ports irrespective of whether USB3.0 ports are implemented. The EHCI controller is provided for legacy OS/driver compatibility which is generally not required for tablet platforms. Using the xHCI controller will deliver significant power and performance benefits.

When following this recommendation on a platform with no USB3.0 support, the Windows logo requirement of USB debug port may not be met. Please consult with Intel regarding the impact of this.

**Note:** Unlike the xHCI, bandwidth of all four ports on the EHCI is shared across a single HS (480 Mbps) internal link.

### 18.3.1 Features of EHCI USB 2.0 Controller

The EHCI USB2.0 Controller supports the following features:

- Compliant with the specification for: USB 1.x, 2.0 (1.5 Mbps, 12 Mbps, 480 Mbps).
- 4 Ports shared with xHCI controller
- Enhanced EHCI descriptor caching
- All ports provided through USB Rate Matching Hubs (RMH) to support FS/LS devices
- Supports one Debug port at USB2 transfer rates
- Supports of USB suspend mode including PLL turn off in S0.
- Supports wakeup from suspend states S5 and remote-suspend wakeup
- All USB2 ports provide support for HS/FS/LS devices
- Per port USB disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 2.0 LPM (L0, L1 and L2 low power states)

### 18.6.1 Vendor ID (VID)—Offset 0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 0h

**Default:** 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	<b>Vendor ID (VID):</b> Reserved.  <b>Power Well:</b> Core

## 18.6.2 Device ID (DID)—Offset 2h

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 2h

**Default:** 8C31h

15		12				8				4			0
1	0	0	0	1	1	0	0	0	0	1	1	0	0
DID													

Bit Range	Default & Access	Field Name (ID): Description
15:0	8C31h RO/V	<b>Device ID (DID):</b> See Global Device ID table in Chap. 6 for value <b>Power Well:</b> Core

## 18.6.3 Command (CMD)—Offset 4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 4h

**Default:** 0000h

15		12				8				4			0	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	
RSVD				ID	FBE	SERR	WCC	PER	VPS	MWI	SCE	BME	MSE	IOSE

Bit Range	Default & Access	Field Name (ID): Description
15:11	00h RO	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
10	0b RW	<b>Interrupt Disable (ID):</b> When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. <b>Power Well:</b> Core
9	0b RO	<b>Fast Back to Back Enable (FBE):</b> Reserved. <b>Power Well:</b> Core
8	0b RW	<b>SERR# Enable (SERR):</b> When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling. <b>Power Well:</b> Core
7	0b RO	<b>Wait Cycle Control (WCC):</b> Reserved. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<b>Parity Error Response (PER):</b> When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.  <b>Power Well:</b> Core
5	0b RO	<b>VGA Palette Snoop (VPS):</b> Reserved.  <b>Power Well:</b> Core
4	0b RO	<b>Memory Write Invalidate (MWI):</b> Reserved.  <b>Power Well:</b> Core
3	0b RO	<b>Special Cycle Enable (SCE):</b> Reserved.  <b>Power Well:</b> Core
2	0b RW	<b>Bus Master Enable (BME):</b> When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.  <b>Power Well:</b> Core
1	0b RW	<b>Memory Space Enable (MSE):</b> This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.  <b>Power Well:</b> Core
0	0b RO	<b>I/O Space Enable (IOSE):</b> Reserved as 0. Read-Only.  <b>Power Well:</b> Core

## 18.6.4 Device Status (STS)—Offset 6h

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 6h

**Default:** 0290h

15	12	8	4	0
0	0	0	0	0
DPE	SSE	RMA	RTA	STA
				DEVT
				MDPED
				FBBC
				UDF
				MC
				CL
				IS
				RSVD

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/1C	<b>Detected Parity Error (DPE):</b> This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
14	0b RW/1C	<b>Signaled System Error (SSE):</b> This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location.  <b>Power Well:</b> Core
13	0b RW/1C	<b>Received Master-Abort Status (RMA):</b> This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.  <b>Power Well:</b> Core
12	0b RW/1C	<b>Received Target Abort Status (RTA):</b> This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.  <b>Power Well:</b> Core
11	0b RW/1C	<b>Signaled Target-Abort Status (STA):</b> This bit is used to indicate when the XHC function responds to a cycle with a target abort.  <b>Power Well:</b> Core
10:9	01b RO	<b>DEVSEL# Timing Status (DEVT):</b> This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.  <b>Power Well:</b> Core
8	0b RW/1C	<b>Master Data Parity Error Detected (MDPED):</b> This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.  <b>Power Well:</b> Core
7	1b RO	<b>Fast Back-to-Back Capable (FBBC):</b> Reserved as 1 Read-Only.  <b>Power Well:</b> Core
6	0b RO	<b>User Definable Features (UDF):</b> Reserved as 0. Read-Only.  <b>Power Well:</b> Core
5	0b RO	<b>66 MHz Capable (MC):</b> Reserved as 0. Read-Only.  <b>Power Well:</b> Core
4	1b RO	<b>Capabilities List (CL):</b> Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.  <b>Power Well:</b> Core
3	0b RO/V	<b>Interrupt Status (IS):</b> This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.  <b>Power Well:</b> Core
2:0	000b RO	<b>Reserved (RSVD):</b> Reserved.  <b>Power Well:</b> Core

## 18.6.5 Revision ID (RID)—Offset 8h

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 8h

**Default:** 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
RID									

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	<b>Revision ID (RID):</b> See Chap 6 for value.  <b>Power Well:</b> Core

## 18.6.6 Programming Interface (PI)—Offset 9h

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 9h

**Default:** 30h

7				4					0
0	0	1	1	0	0	0	0	0	0
PI									

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	<b>Programming Interface (PI):</b> A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.  <b>Power Well:</b> Core

## 18.6.7 Sub Class Code (SCC)—Offset Ah

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + Ah

**Default:** 03h

7				4					0
0	0	0	0	0	0	0	1	1	1
SCC									

Bit Range	Default & Access	Field Name (ID): Description
7:0	03h RO	<b>Sub Class Code (SCC):</b> A value of 03h indicates that this is a Universal Serial Bus Host Controller.  <b>Power Well:</b> Core

## 18.6.8 Base Class Code (BCC)—Offset Bh

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + Bh

**Default:** 0Ch

7				4				0
0	0	0	0	0	1	1	0	0
BCC								

Bit Range	Default & Access	Field Name (ID): Description
7:0	0Ch RO	<b>Base Class Code (BCC):</b> A value of 0Ch indicates that this is a Serial Bus controller.  <b>Power Well:</b> Core

## 18.6.9 Master Latency Timer (MLT)—Offset Dh

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + Dh

**Default:** 00h

7				4				0
0	0	0	0	0	0	0	0	0
MLT								

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	<b>Master Latency Timer (MLT):</b> Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.  <b>Power Well:</b> Core

## 18.6.10 Header Type (HT)—Offset Eh

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + Eh

**Default:** 00h

7	4	0
0	0	0
MFB	CL	

Bit Range	Default & Access	Field Name (ID): Description
7	0b RO	<b>Multi-Function Bit (MFB):</b> Read only indicating single function device. <b>Power Well:</b> Core
6:0	00h RO	<b>Configuration layout (CL):</b> Hardwired to 0 to indicate a standard PCI configuration layout. <b>Power Well:</b> Core

### 18.6.11 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 64 bits)

**Offset:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000004h

6	6	5	5	4	4	4	3	3	2	2	2	1	1	8	4	0
3	0	6	2	8	4	0	6	2	8	4	0	6	2	0	0	0
BA												RSVD			Prefetchable Type	RTE

Bit Range	Default & Access	Field Name (ID): Description
63:16	00000000 000h RW	<b>Base Address (BA):</b> Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries. <b>Power Well:</b> Core
15:4	000h RO	<b>Reserved (RSVD):</b> Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory. <b>Power Well:</b> Core
3	0b RO	<b>Prefetchable:</b> This bit is hardwired to 0 indicating that this range should not be prefetched. <b>Power Well:</b> Core
2:1	10b RO	<b>Type:</b> If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
0	0b RO	<b>Resource Type Indicator (RTE):</b> This bit is hardwired to 0 indicating that the base address field in this register maps to memory space  <b>Power Well:</b> Core

### 18.6.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 2Ch

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
SSVID				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	<b>USB Subsystem Vendor ID (SSVID):</b> This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. NOT for EDS:Writes to this register are controlled by the Access Control bit (ACCTRL).  <b>Power Well:</b> Core

### 18.6.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 2Eh

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
SSID				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	<b>USB Subsystem ID (SSID):</b> BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). NOT for EDS: Writes to this register are controlled by the Access Control bit (ACCTRL).  <b>Power Well:</b> Core

### 18.6.14 Capabilities Pointer (CAP\_PTR)—Offset 34h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 34h

**Default:** 70h

7	4	0
0	1	0
CAP_PTR		

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	<b>Capabilities Pointer (CAP_PTR):</b> This register points to the starting offset of the capabilities ranges.  <b>Power Well:</b> Core

### 18.6.15 Interrupt Line (ILINE)—Offset 3Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 3Ch

**Default:** 00h

7	4	0
0	0	0
ILINE		

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	<b>Interrupt Line (ILINE):</b> This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.  <b>Power Well:</b> Core

### 18.6.16 Interrupt Pin (IPIN)—Offset 3Dh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 3Dh

**Default:** 00h

7	4	0
0	0	0
IPIN		

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	<b>Interrupt pin (IPIN):</b> Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. See Chap 6 for value.  <b>Power Well:</b> Core

## 18.6.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + 40h

**Default:** 000000FDh

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	1						
0	0	0	0	0	0	0	0	1						
0	0	0	0	0	0	0	0	1						
0	0	0	0	0	0	0	0	1						
ACCTRL	ECO1	RMTASERR	URD	URRE	IIL1E	XHCIL1E	D3IL1E	PCPWT	SWAXHCI	L23HRAWC	UTAGCP	UDAGCNP	UDAGCCP	UDAGC

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/O	<b>Access Control (ACCTRL):</b> This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.  <b>Power Well:</b> Core
30:25	00h RW	<b>ECO1:</b> ECO bits are used during silicon bringup for FIBing. NOT for EDS  <b>Power Well:</b> Core
24	0b RW	<b>Master/Target Abort SERR (RMTASERR):</b> When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.  <b>Power Well:</b> Core
23	0b RW/C	<b>Unsupported Request Detected (URD):</b> Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.  <b>Power Well:</b> Core
22	0b RW	<b>Unsupported Request Report Enable (URRE):</b> When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.  <b>Power Well:</b> Core
21:19	000b RW	<b>Inactivity Initiated L1 Enable (IIL1E):</b> If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
18	0b RW	<b>XHC Initiated L1 Enable (XHCIL1E):</b> If set, allow the XHC initiated L1 power mangement to be enabled. <b>Power Well:</b> Core
17	0b RW	<b>D3 Initiated L1 Enable (D3IL1E):</b> If set, allow PCI device state D3 initiated L1 power managment to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set. <b>Power Well:</b> Core
16:12	00h RW	<b>Periodic Complete Pre Wake Time (PCPWT):</b> signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less <b>Power Well:</b> Core
11	0h RW	<b>SW Assisted xHC Idle (SWAXHCI):</b> This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state. <b>Power Well:</b> Core
10:8	000b RW	<b>L23 to Host Reset Acknowledge Wait Count (L23HRAWC):</b> If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk <b>Power Well:</b> Core
7:6	11b RW	<b>Upstream Type Arbiter Grant Count Posted (UTAGCP):</b> Grant count for IOSF upstream L2 request type arbiter for posted type <b>Power Well:</b> Core
5:4	11b RW	<b>Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):</b> Grant count for IOSF upstream L2 type arbiter for non-posted type <b>Power Well:</b> Core
3:2	11b RW	<b>Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):</b> Grant count for IOSF upstream L2 type arbiter for completion type <b>Power Well:</b> Core
1:0	01b RW	<b>Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):</b> Grant count for IOSF upstream L1 device arbiter <b>Power Well:</b> Core

## 18.6.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + 44h

**Default:** 0003C000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	1	1	1	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/O	<b>OC Configuration Done (OCCFGDONE):</b> This bit is used by BIOS to prevent spurious switching during OC configuration. Any write this register bit will cause it to set. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.  <b>Power Well:</b> SUS
30:26	00h RW	<b>ECO1:</b> NOT for EDS ECO bits are used during silicon bringup for FIBing.  <b>Power Well:</b> Core
25	0b RW	<b>DMA Request Boundary Crossing Control (DREQBCC):</b> This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B  <b>Power Well:</b> Core
24:22	0h RW	<b>IDMA Read Request Size Control (IDMA_RDREQSZCTRL):</b> Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B  <b>Power Well:</b> Core
21	0b RW	<b>XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):</b> This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.  <b>Power Well:</b> Core
20	0b RW	<b>IOSF Sideband Register Access Disable (IOSFSRAD):</b> When set, it disables the IOSF sideband interface from accepting any host space register access.  <b>Power Well:</b> Core
19:14	0Fh RW	<b>Upstream Non-Posted Pre-Allocation (UNPPA):</b> This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
13:12	00b RW	<p><b>SW Assisted xHC Idle Policy (SWAXHCIP):</b> Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved</p> <p><b>Power Well:</b> Core</p>
11	0h RW	<p><b>MMIO Read After MMIO Write Delay Disable (RAWDD):</b> This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.</p> <p><b>Power Well:</b> Core</p>
10	0h RW	<p><b>MMIO Write After MMIO Write Delay Enable (WAWDE):</b> This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
29:16	0000h RO/V	<b>Captured Frame List Current Index/Frame Number (CMFI):</b> The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX <b>Power Well:</b> Core
15:13	0h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
12:0	0000h RO/V	<b>Captured Micro-frame BLIF (CMFB):</b> The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA. <b>Power Well:</b> Core

### 18.6.21 Serial Bus Release Number (SBRN)—Offset 60h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 60h

**Default:** 30h

7				4					0
0	0	1	1	0	0	0	0	0	0
SBRN									

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	<b>Serial Bus Release Number (SBRN):</b> A value of 30h indicates that this controller follows USB release 3.0. <b>Power Well:</b> SUS

### 18.6.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 61h

**Default:** 20h

7		4		0
0	0	1	0	0

7:4	0h RW/L	<b>Default Best Effort Service Latency Deep (DBESLD):</b> Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters. <b>Power Well:</b> Core
3:0	0h RW/L	<b>Default Best Effort Service Latency (DBESL):</b> If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters. <b>Power Well:</b> Core

### 18.6.24 PCI Power Management Capability ID (PM\_CID)—Offset 70h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 70h

**Default:** 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RO	<b>PCI Power Management Capability ID (PM_CID):</b> A value of 01h indicates that this is a PCI Power Management capabilities field.  <b>Power Well:</b> Core

### 18.6.25 Next Item Pointer #1 (PM\_NEXT)—Offset 71h

This register is modified and maintained by BIOS

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Offset:** [B:0, D:20, F:0] + 71h

**Default:** 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	<b>Next Item Pointer #1 (PM_NEXT):</b> This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.  <b>Power Well:</b> Core

### 18.6.26 Power Management Capabilities (PM\_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 72h

**Default:** C1C2h

0	0	0	1	1
0	0	0	0	0
0	0	0	0	0
0	0	0	0	1
0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
15:11	11000b RW/L	<b>PME_Support:</b> This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field. NOT for EDS: However, the ability to change this field may prove useful for some systems. <b>Power Well:</b> Core
10	0b RW/L	<b>D2_Support:</b> The D2 state is not supported. <b>Power Well:</b> Core
9	0b RW/L	<b>D1_Support:</b> The D1 state is not supported. <b>Power Well:</b> Core
8:6	111b RW/L	<b>Aux_Current:</b> The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. <b>Power Well:</b> Core
5	0b RW/L	<b>DSI:</b> The Intel PCH reports 0, indicating that no device-specific initialization is required. <b>Power Well:</b> Core
4	0b RO	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
3	0b RW/L	<b>PME Clock (PMEClock):</b> The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#. <b>Power Well:</b> Core
2:0	010b RW/L	<b>Version:</b> The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification. <b>Power Well:</b> Core

## 18.6.27 Power Management Control/Status (PM\_CS)—Offset 74h

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Offset:** [B:0, D:20, F:0] + 74h

**Default:** 0008h

15	12	8	4	0
0	0 0 0	0 0 0	0 0 0 0	1 0 0 0
PME_Status	Data_Scale	Data_Select	PME_En	RSVD
				NSR
				RSVD2
				PowerState

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/1C	<b>PME_Status:</b> This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.  <b>Power Well:</b> SUS
14:13	00b RO	<b>Data_Scale:</b> The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.  <b>Power Well:</b> Core
12:9	0h RO	<b>Data_Select:</b> The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.  <b>Power Well:</b> Core
8	0b RW	<b>PME_En:</b> A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.  <b>Power Well:</b> SUS
7:4	0h RO	<b>Reserved (RSVD):</b> Reserved.  <b>Power Well:</b> Core
3	1b RO	<b>No Soft Reset (NSR):</b> , this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.  <b>Power Well:</b> Core
2	0b RO	<b>Reserved (RSVD2):</b> Reserved.  <b>Power Well:</b> Core
1:0	00b RW	<b>PowerState:</b> This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible.  <b>Power Well:</b> Core

## 18.6.28 Message Signaled Interrupt CID (MSI\_CID)—Offset 80h

### Access Method

**Type:** PCI Configuration Register

### 18.6.32 Message Signaled Interrupt Upper Address (MSI\_MUAD)— Offset 88h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits) **Offset:** [B:0, D:20, F:0] + 88h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Upper Addr (UpperAddr):</b> Upper DW of system specified message address.  <b>Power Well:</b> Core

### 18.6.33 Message Signaled Interrupt Message Data (MSI\_MD)—Offset 8Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits) **Offset:** [B:0, D:20, F:0] + 8Ch

**Default:** 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<b>Data:</b> This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.  <b>Power Well:</b> Core

#### 18.6.40 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset CCh

The RW/L property of this register is controlled by OCCFDONE bit. Note: U3OCM2 allows the OC pins 8:5 to be mapped to the same 6 SS ports that U3OCM1 allows. This allows flexibility in pairing SS ports with HS ports at the connector. Care must be taken to make sure OC pin assignment is consistent across USB3 and USB2 ports (depending upon the pairing).

##### Access Method

3:0	0h RW/O	<b>USB3 Port Disable Override (USB3PDO):</b> A '1' in a bit position prevents the corresponding USB3 port from reporting a Device Connection to the XHC.  <b>Power Well:</b> SUS

## 18.6.48 USB2 FS/LS Port Staggering Control (FSLSPS)—Offset Ech

The host controller provides a programmable time offset for each FS/LS port. Based on the value programmed in these registers, the controller will inject a fixed delay on each FS or LS transaction initiated on that port.

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + Ech

**Default:** 0000D8D8h

### 18.7.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is used as an offset to add to register base, to find the beginning of the Operational Register Space. This register is modified and maintained by BIOS.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [MBAR] + 0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 80h

7	4	0
1	0	0
CAPLENGTH		

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	<p><b>Capability Registers Length (CAPLENGTH):</b> This field is used as an offset to add to register base, to find the beginning of the Operational Register Space.</p> <p><b>Power Well:</b> Core</p>

### 18.7.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0. This register is modified and maintained by BIOS.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [MBAR] + 2h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0100h RO	<p><b>Host Controller Interface Version Number (HCIVERSION):</b> This is a two-byte field containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this field represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0.</p> <p><b>Power Well:</b> Core</p>

### 18.7.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register defines basic structural parameters supported by this xHC implementation: Number of Device Slots support, Interrupters, Root Hub ports, etc. This register is modified and maintained by BIOS.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 07000820h

Bit Range	Default & Access	Field Name (ID): Description
31:24	07h RO	<p><b>Number of Ports (MaxPorts):</b> This field specifies the maximum Port Number value, i.e the highest number of Port Register Sets that are addressable in the Operational Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to FFh.</p> <p>The value in this field shall reflect the maximum Port Number value assigned by an <i>xHCI Supported Protocol Capability</i>, described in the xHCI for USB specification. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.</p> <p><b>Power Well:</b> Core</p>
23:19	00h RW/L	<p><b>Rsvd1:</b> Reserved.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
25:8	00000h RW/L	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
7:4	5h RW/L	<b>Event Ring Segment Table Max (ERSTMax):</b> Valid values are 0-15. This field determines the maximum value supported by the <i>Event Ring Segment Table Base Size</i> registers (5.5.2.3.1), where The maximum number of Event Ring Segment Table entries = 2^(ERST Max) e.g. if the ERST Max = 7, then the xHC <i>Event Ring Segment Table(s)</i> supports up to 128 entries, if ERST Max = 15, then 32K entries, etc. <b>Power Well:</b> Core
3:0	4h RW/L	<b>Isochronous Scheduling Threshold (IST):</b> The value in this field indicates to system software the minimum distance (in time) that it is required to stay ahead of the host controller while adding TRBs, in order to have the host controller process them at the correct time. The value shall be specified in terms of number of frames/microframes. If bit [3] of IST is cleared to '0', software can add a TRB no later than IST[2:0] microframes before that TRB is scheduled to be executed. If bit [3] of IST is set to '1', software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed. Refer to the xHCI for USB specification for details on how software uses this information for scheduling isochronous transfers. <b>Power Well:</b> Core

### 18.7.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register defines link exit latency related structural parameters. This register is modified and maintained by BIOS.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00040001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
U2DEL				Rsvd1				U1DEL

Bit Range	Default & Access	Field Name (ID): Description
31:16	0004h RW/L	<b>U2 Device Exit Latency (U2DEL):</b> Worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: <ul style="list-style-type: none"> <li>• 0000h = Zero</li> <li>• 0001h = Less than 1 s</li> <li>• 0002h = Less than 2 s</li> <li>• 07FFh = Less than 2047 s.</li> <li>• 0800-FFFFh = Reserved</li> </ul> <b>Power Well:</b> Core

### 18.7.6 Capability Parameters (HCCPARAMS)—Offset 10h

The default values for all fields in this register are implementation dependent. This register defines optional capabilities supported by the xHCI. This register is modified and maintained by BIOS.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 10h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 200071E1h

31	28	24	20	16	12	8	4	0						
0	0	1	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	1						
		xECP		MaxPSASize	Rsvd1	PAE	NSS	LTC	LHRC	PIIND	PPC	CSZ	BNC	AC64

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	<b>xHCI Extended Capabilities Pointer (xECP):</b> This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability. For example, using the offset of Base is 1000h and the xECP value of 0068h, we can calculate the following effective address of the first extended capability: 1000h + (0068h (( 2 ) -) 1000h + 01A0h -) 11A0h a. This is not tightly coupled with the USBBASE address register mapping control. <b>Power Well:</b> Core
15:12	7h RW/L	<b>Maximum Primary Stream Array Size (MaxPSASize):</b> This field identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2^(MaxPSASize+1). Valid MaxPSASize values are 0 to 15, where 0 indicates that Streams are not supported. <b>Power Well:</b> Core
11:9	0h RW/L	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
8	1b RW/L	<p><b>Parse All Event Data (PAE):</b> This flag indicates whether the host controller implementation parses all Event Data TRBs while advancing to the next TD after a Short Packet, or skips all but the first Event Data TRB. A 1 in this bit indicates that all Event Data TRBs are parsed. A 0 in this bit indicates that only the first Event Data TRB is parsed. Refer to the xHCI for USB specification.</p> <p><b>Power Well:</b> Core</p>
7	1b RW/L	<p><b>No Secondary SID Support (NSS):</b> This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. Refer to the xHCI for USB specification.</p> <p><b>Power Well:</b> Core</p>
6	1b RW/L	<p><b>Latency Tolerance Messaging Capability (LTC):</b> This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to the xHCI for USB specification.</p> <p><b>Power Well:</b> Core</p>
5	1b RW/L	<p><b>Light HC Reset Capability (LHRC):</b> This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the <i>Light Host Controller Reset</i> (LHCRST) flag in the USBCMD register. Refer to the xHCI for USB specification.</p> <p><b>Power Well:</b> Core</p>
4	0b RW/L	<p><b>Port Indicators (PIND):</b> This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/ writeable field for controlling the state of the port indicator. Refer to the xHCI for USB specification for the definition of the <i>Port Indicator Control</i> field.</p> <p><b>Power Well:</b> Core</p>
3	0b RO	<p><b>Port Power Control (PPC):</b> This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port does not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register. See the xHCI for USB specification.</p> <p><b>Power Well:</b> Core</p>
2	0b RW/L	<p><b>Context Size (CSZ):</b> If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does <i>not</i> apply to Stream Contexts.</p> <p><b>Power Well:</b> Core</p>
1	0b RW/L	<p><b>BW Negotiation Capability (BNC):</b> This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation:</p> <ul style="list-style-type: none"> <li>0 = BW Negotiation not implemented</li> <li>1 = BW Negotiation implemented</li> </ul> <p>Refer to the xHCI for USB specification for more information on Bandwidth Negotiation.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
0	1b RW/L	<p><b>64-bit Addressing Capability (AC64):</b> This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation:</p> <ul style="list-style-type: none"> <li>0 = 32-bit address memory pointers implemented</li> <li>1 = 64-bit address memory pointers implemented</li> </ul> <p>If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.</p> <p><b>Power Well:</b> Core</p>

### 18.7.7 Doorbell Offset (DBOFF)—Offset 14h

This register defines the offset of the Doorbell Array base address from the Base.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 14h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

Rsvd2						EU3S	EWE	CRS
Rsvd2						CSS	LHCRST	Rsvd1
Rsvd2						HSEE	INTE	HCRST
Rsvd2						RS		

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RO	<b>Rsvd2:</b> Reserved.  <b>Power Well:</b> Core
11	0b RW	<b>Enable U3 MFINDEX Stop (EU3S):</b> When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to the xHCI for USB specification for more information.  <b>Power Well:</b> Core
10	0b RW	<b>Enable Wrap Event (EWE):</b> When set to 1, the xHC shall generate an MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
9	0b RW	<p><b>Controller Restore State (CRS):</b> When set to 1, and HCHalted (HCH) = 1, then the xHC shall perform a Restore State operation and restore its internal state. When set to 1 and Run/Stop (R/S) = 1 or HCHalted (HCH) = 0, or when cleared to 0, no Restore State operation shall be performed. This flag always returns 0 when read. Refer to the <i>Restore State Status</i> (RSS) flag in the USBSTS register for information on Restore State completion. Refer to the xHCI for USB specification, for more information. Note that undefined behavior may occur if a Restore State operation is initiated while <i>Save State Status</i> (SSS) = 1.</p> <p>When this register is exposed by a Virtual Function (VF), this bit only controls restoring the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
8	0b RW	<p><b>Controller Save State (CSS):</b> When written by software with 1 and HCHalted (HCH) = 1, then the xHC shall save any internal state that may be restored by a subsequent Restore State operation. When written by software with 1 and HCHalted (HCH) = 0, or written with 0, no Save State operation shall be performed. This flag always returns 0 when read. Refer to the <i>Save State Status</i> (SSS) flag in the USBSTS register for information on Save State completion. Refer to the xHCI for USB specification for more information on xHC Save/Restore operation. Note that undefined behavior may occur if a Save State operation is initiated while <i>Restore State Status</i> (RSS) = 1.</p> <p>When this register is exposed by a Virtual Function (VF), this bit only controls saving the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
7	0b RW	<p><b>Light Host Controller Reset (LHCRST):</b> Optional normative. If the <i>Light HC Reset Capability</i> (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports.</p> <p>A system software read of this bit as 0 indicates the <i>Light Host Controller Reset</i> has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the <i>Light Host Controller Reset</i> has not yet completed.</p> <p>If not implemented, a read of this flag shall always return a 0.</p> <p>All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. (Refer to the xHCI for USB specification for more information.)</p> <p>When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. disabling the VF's device slots and setting the associated VF Run bit to Stopped. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
6:4	0h RO	<p><b>Rsvd1:</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
3	0b RW	<p><b>Host System Error Enable (HSEE):</b> When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to the xHCI for USB specification for more information.</p> <p>When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	<p><b>Interrupter Enable (INTE):</b> This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, i.e. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSIX, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism.</p> <p>When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF.</p> <p><b>Power Well:</b> Core</p>
1	0b RW	<p><b>Host Controller Reset (HCRST):</b> This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset.</p> <p>When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reseta shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller, as described in the xHCI for USB specification, in order to return the host controller to an operational state.</p> <p>This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
0	0b RW	<p><b>Run/Stop (RS):</b></p> <ul style="list-style-type: none"> <li>• 1 = Run</li> <li>• 0 = Stop</li> </ul> <p>When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may yield undefined resultsresult in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF.</p> <p><b>Power Well:</b> Core</p>

### 18.7.10 USB Status (USBSTS)—Offset 84h

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to '0' in this register by writing a '1' to it (RW1C). Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)* for additional information concerning USB interrupt conditions.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

12	0b RO	<b>Host Controller Error (HCE):</b> This bit is not preset in HC, this is deviation from XHCI 1.0 spec.  <b>Power Well:</b> Core
11	0b RO	<b>Controller Not Ready (CNR):</b> This is deviation from XHCI 1.0 spec.  <b>Power Well:</b> Core
10	0b RW/C	<b>Save/Restore Error (SRE):</b> If an error occurs during a Save or Restore operation, this bit shall be set to 1. This bit shall be cleared to 0 when a Save or Restore operation is initiated or when written with 1. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to the xHCI for USB specification for more information.  <b>Power Well:</b> Core
9	0b RO	<b>Restore State Status (RSS):</b> When the Controller Restore State (CRS) flag in the USBCMD register is written with 1 this bit shall be set to 1 and remain 1 while the xHC restores its internal state. When the Restore State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the restoring the state for the selected VF. Refer to the xHCI for USB specification for more information.  <b>Power Well:</b> Core
8	0b RO	<b>Save State Status (SSS):</b> When the <i>Controller Save State</i> (CSS) flag in the USBCMD register is written with 1, this bit shall be set to 1 and remain 1 while the xHC saves its internal state. When the Save State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the saving the state for the selected VF. Refer to the xHCI for USB specification for more information.  <b>Power Well:</b> Core
7:5	0h RO	<b>Rsvd2:</b> Reserved.  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW/C	<p><b>Port Change Detect (PCD):</b> The xHC sets this bit to a 1 when any port has a change bit transition from a 0 to a 1. This bit is allowed to be maintained in the Aux Power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits. Refer to the xHCI for USB specification for more information. This bit provides system software an efficient means of determining if there has been Root Hub port activity. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Root Hub Ports associated with the Device Slots assigned to the selected VF. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
3	0b RW/C	<p><b>Event Interrupt (EINT):</b> The xHC sets this bit to 1 when the <i>Interrupt Pending (IP)</i> bit of any Interrupter transitions from 0 to 1. Refer to the xHCI for USB specification for usage information. Software that uses <i>EINT</i> shall clear it prior to clearing any IP flags. A race condition may occur if software clears the <i>IP</i> flags, then clears the <i>EINT</i> flag, and between the operations another <i>IP</i> 0 to '1' transition occurs. In this case, the new IP transition shall be lost. When this register is exposed by a Virtual Function (VF), this bit is the logical 'OR' of the IP bits for the Interrupters assigned to the selected VF. And it shall be cleared to 0 when all associated interrupter IP bits are cleared, i.e. all the VFs Interrupter Event Ring(s) are empty. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
2	0b RW/C	<p><b>Host System Error (HSE):</b> The xHC sets this bit to 1 when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. (In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort.) When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USBCMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USBCMD register is a 1, the xHC shall also assert out-of-band error signaling to the host. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the assertion of this bit affects all VFs and reflects the Host System Error state of the Physical Function (PF0). Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
1	0b RO	<p><b>Rsvd1:</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
0	1b RO	<p><b>HCHalted (HCH):</b> This bit is a 0 whenever the <i>Run/Stop (R/S)</i> bit is a 1. The xHC sets this bit to 1 after it has stopped executing as a result of the <i>Run/Stop (R/S)</i> bit being cleared to 0, either by software or by the xHC hardware (e.g. internal error). If this bit is '1', then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC, and any received Transaction Packet shall be dropped. When this register is exposed by a Virtual Function (VF), this bit only reflects the Halted state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>

### 18.7.11 Page Size (PAGESIZE)—Offset 88h

The default value for this register is implementation dependent.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 88h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
15:0	0001h RO	<b>Page Size (PAGESIZE):</b> This field defines the page size supported by the xHC implementation. This xHC supports a page size of $2^{(n+12)}$ if bit n is Set. For example, if bit 0 is Set, the xHC supports 4k byte page sizes. For a Virtual Function, this register reflects the page size selected in the <i>System Page Size</i> field of the SR-IOV Extended Capability structure. For the Physical Function 0, this register reflects the implementation dependent default xHC page size. Various xHC resources reference PAGESIZE to describe their minimum alignment requirements. The maximum possible page size is 128M. <b>Power Well:</b> Core

### 18.7.12 Device Notification Control (DNCTRL)—Offset 94h

This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A *Notification Enable* (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset, all notifications are disabled. Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)*. This register shall be written as a Dword. Byte writes produce undefined results.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 94h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<p><b>Notification Enable (NO_N15):</b> When a Notification Enable bit is set, a Device Notification Event shall be generated when a Device Notification Transaction Packet is received with the matching value in the Notification Type field. For example, setting N1 to '1' enables Device Notification Event generation if a Device Notification TP is received with a Notification Type field set to '1' (FUNCTIONAL_WAKE), etc.</p> <p><b>Power Well:</b> Core</p>

### 18.7.13 Command Ring Low (CRCR\_LO)—Offset 98h

The Command Ring Control Register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 98h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

CRP							Rsvd1	CRR	CA	CS	RCS

Bit Range	Default & Access	Field Name (ID): Description
31:6	0000000h RW	<p><b>Command Ring Pointer (CRP):</b> This field defines low order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when <i>Command Ring Running (CCR) = '1'</i>. If the CRCR is written while the Command Ring is stopped (CCR = '0'), the value of this field shall be used to fetch the first Command TRB the next time the <i>Host Controller Doorbell</i> register is written with the DB Reason field set to Host Controller Command. If the CRCR is <i>not</i> written while the Command Ring is stopped (CRR = '0') then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns '0'.</p> <p><b>Power Well:</b> Core</p>
5:4	0h RO	<p><b>Rsvd1:</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
3	0b RO	<p><b>Command Ring Running (CRR):</b> This flag is set to '1' if the <i>Run/Stop (R/S)</i> bit is '1' and the <i>Host Controller Doorbell</i> register is written with the <i>DB Reason</i> field set to <i>Host Controller Command</i>. It is cleared to '0' when the Command Ring is 'stopped' after writing a '1' to the <i>Command Stop (CS)</i> or <i>Command Abort (CA)</i> flags, or if the <i>R/S</i> bit is cleared to '0'.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW/S	<p><b>Command Abort (CA):</b> Writing a '1' to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to the xHCI for USB specification for more information on aborting a command. The next write to the <i>Host Controller Doorbell</i> with <i>DB Reason</i> field set to <i>Host Controller Command</i> shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if <i>Command Ring Running</i> (CCR) = '0'. Reading this bit always returns '0'.</p> <p><b>Power Well:</b> Core</p>
1	0b RW/S	<p><b>Command Stop (CS):</b> Writing a '1' to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a <i>Command Completion Event</i> with the <i>Completion Code</i> set to <i>Command Ring Stopped</i> and the <i>Command TRB Pointer</i> set to the current value of the <i>Command Ring Dequeue Pointer</i>. Refer to the xHCI for USB specification for more information on stopping a command. The next write to the <i>Host Controller Doorbell</i> with <i>DB Reason</i> field set to <i>Host Controller Command</i> shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if <i>Command Ring Running</i> (CCR) = '0'. Reading this bit shall always return '0'.</p> <p><b>Power Well:</b> Core</p>
0	0b RW	<p><b>Ring Cycle State (RCS):</b> This bit identifies the value of the xHC <i>Consumer Cycle State</i> (CCS) flag for the TRB referenced by the <i>Command Ring Pointer</i>. Refer to the xHCI for USB specification for more information. Writes to this flag are ignored if <i>Command Ring Running</i> is '1'. If the CRCR is written while the Command Ring is stopped (CCR = '0'), then the value of this flag shall be used to fetch the first Command TRB the next time the <i>Host Controller Doorbell</i> register is written with the <i>DB Reason</i> field set to <i>Host Controller Command</i>. If the CRCR is <i>not</i> written while the Command Ring is stopped (CCR = '0'), then the Command Ring shall begin fetching Command TRBs using the current value of the <i>Internal Command Ring CCS</i> flag. Reading this flag always returns '0'.</p> <p><b>Power Well:</b> Core</p>

### 18.7.14 Command Ring High (CRCR\_HI)—Offset 9Ch

The Command Ring Control Register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 9Ch

### 18.7.26 Port X Hardware LPM Control Register (PORTHLPM3)—Offset 4ACh

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

#### Access Method

### 18.7.35 Port X Hardware LPM Control Register (PORTHLPM6)—Offset 4DCh

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 4DCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

### 18.7.39 Microframe Index (MFINDEX)—Offset 2000h

This register is used by the system software to determine the current periodic frame. The register value is incremented every 125 microseconds (once each microframe). This register is only incremented while *Run/Stop* = '1'. The value of this register affects the SOF value generated by USB2 Bus Instances.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

### 18.7.41 Interrupter 1 Moderation (IMOD1)—Offset 2024h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers.  $x = 1, 2, \dots 8$ .

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2024h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000FA0h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
IMODC				IMODI				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>Interrupt Moderation Counter (IMODC):</b> Down counter. Loaded with the IMODI value whenever <i>IP</i> is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags both equal '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate. <b>Power Well:</b> Core
15:0	0FA0h RW	<b>Interrupt Moderation Interval (IMODI):</b> Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty. <b>Power Well:</b> Core

### 18.7.42 Event Ring Segment Table Size 1 (ERSTSZ1)—Offset 2028h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers.  $x = 1, 2, \dots 8$ .

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2028h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Rsvd1:</b> Reserved.  <b>Power Well:</b> Core
15:0	0000h RW	<b>Event Ring Segment Table Size (ERSTS):</b> This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.  <b>Power Well:</b> Core

### 18.7.43 Event Ring Segment Table Base Address Low 1 (ERSTBA\_LO1)—Offset 2030h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA\_LOx registers, with x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2030h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0000000h RW	<b>Event Ring Segment Table Base Address Register (ERSTBA_LO):</b> This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.  <b>Power Well:</b> Core
5:0	00h RO	<b>Rsvd1:</b> Reserved.  <b>Power Well:</b> Core

### 18.7.44 Event Ring Segment Table Base Address High 1 (ERSTBA\_HI1)—Offset 2034h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA\_HIx registers, with x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2034h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

### 18.7.51 Event Ring Segment Table Base Address High 2 (ERSTBA\_HI2)—Offset 2054h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA\_HIx registers, with x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2054h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

ERDP							EHB	DESI

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	<b>Event Ring Dequeue Pointer (ERDP)</b> : This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.  <b>Power Well:</b> Core
3	0b RW/C	<b>Event Handler Busy (EHB)</b> : This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.  <b>Power Well:</b> Core
2:0	0h RW	<b>Dequeue ERST Segment Index (DESI)</b> : This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.  <b>Power Well:</b> Core

### 18.7.53 Event Ring Dequeue Pointer High 2 (ERDP\_HI2)—Offset 205Ch

There are 8 ERDP\_HIx registers, with x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 205Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Event Ring Dequeue Pointer (ERDP):</b> This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.  <b>Power Well:</b> Core

### 18.7.54 Interrupter 3 Management (IMAN3)—Offset 2060h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2060h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

**Offset:** [MBAR] + 20FCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Event Ring Dequeue Pointer (ERDP):</b> This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer. <b>Power Well:</b> Core

### 18.7.89 Interrupter 8 Management (IMAN8)—Offset 2100h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2100h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

0	0b RW/C	<b>Interrupt Pending (IP):</b> Reserved. <b>Power Well:</b> Core

### 18.7.90 Interrupter 8 Moderation (IMOD8)—Offset 2104h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2104h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000FA0h

IMODC				IMODI				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>Interrupt Moderation Counter (IMODC):</b> Down counter. Loaded with the IMODI value whenever <i>IP</i> is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
15:0	0FA0h RW	<b>Interrupt Moderation Interval (IMODI):</b> Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.  <b>Power Well:</b> Core

### 18.7.91 Event Ring Segment Table Size 8 (ERSTSZ8)—Offset 2108h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2108h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Rsvd1:</b> Reserved.  <b>Power Well:</b> Core
15:0	0000h RW	<b>Event Ring Segment Table Size (ERSTS):</b> This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.  <b>Power Well:</b> Core

### 18.7.92 Event Ring Segment Table Base Address Low 8 (ERSTBA\_LO8)—Offset 2110h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA\_LOx registers, with x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2110h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	<p><b>Event Ring Dequeue Pointer (ERDP):</b> This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.</p> <p><b>Power Well:</b> Core</p>
3	0b RW/C	<p><b>Event Handler Busy (EHB):</b> This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.</p> <p><b>Power Well:</b> Core</p>
2:0	0h RW	<p><b>Dequeue ERST Segment Index (DESI):</b> This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.</p> <p><b>Power Well:</b> Core</p>

### 18.7.95 Event Ring Dequeue Pointer High 8 (ERDP\_HI8)—Offset 211Ch

There are 8 ERDP\_HIx registers, with x = 1, 2, ... 8.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 211Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Event Ring Dequeue Pointer (ERDP):</b> This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer. <b>Power Well:</b> Core

### 18.7.96 Door Bell 1 (DOORBELL1)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>DB Stream ID (DBSID):</b> If the endpoint of a Device Context Doorbell defines Streams, then this field shall be used to identify which Stream of the endpoint the doorbell reference is targeting. System software is responsible for ensuring that the value written to this field is valid. If the endpoint defines Streams ( <i>MaxPStreams</i> > 0), then 0, 65535 (No Stream) and 65534 (Prime) are reserved Stream ID values and shall not be written to this field. If the endpoint does not define Streams ( <i>MaxPStreams</i> = 0) and a non-'0' value is written to this field, the doorbell reference shall be ignored. This field only applies to <i>Device Context Doorbells</i> and shall be cleared to 0 for <i>Host Controller Command Doorbells</i> . This field returns 0 when read. <b>Power Well:</b> Core
15:8	00h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	<p><b>DB Target (DBT):</b> This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Note that Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers.</p> <ul style="list-style-type: none"> <li>• <b>Device Context Doorbells (1-255)</b></li> <li>• 0 = Reserved</li> <li>• 1 = Control EP 0 Enqueue Pointer Update</li> <li>• 2 = EP 1 OUT Enqueue Pointer Update</li> <li>• 3 = EP 1 IN Enqueue Pointer Update</li> <li>• 4 = EP 2 OUT Enqueue Pointer Update</li> <li>• 5 = EP 2 IN Enqueue Pointer Update</li> <li>• ...</li> <li>• 30 = EP 15 OUT Enqueue Pointer Update</li> <li>• 31 = EP 15 IN Enqueue Pointer Update</li> <li>• 32:247 = Reserved</li> <li>• 248:255 = Vendor Defined</li> <li>• <b>Host Controller Doorbell (0)</b></li> <li>• 0 = Command Doorbell</li> <li>• 248:255 = Vendor Defined</li> </ul> <p>This field returns '0' when read, and should be treated as 'undefined' by software. When the Command Doorbell is written, the DB Stream ID field shall be cleared to 0.</p> <p><b>Power Well:</b> Core</p>

### 18.7.97 Door Bell 2 (DOORBELL2)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3004h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<p><b>DB Stream ID (DBSID):</b> Refer to field descriptions for the DOORBELL1 register.</p> <p><b>Power Well:</b> Core</p>

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3030h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>DB Stream ID (DBSID):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core
15:8	00h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
7:0	00h RW	<b>DB Target (DBT):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core

### 18.7.109 Door Bell 14 (DOORBELL14)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3034h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>DB Stream ID (DBSID):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core
15:8	00h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
7:0	00h RW	<b>DB Target (DBT):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core

### 18.7.110 Door Bell 15 (DOORBELL15)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3038h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31:16	0000h RW	<b>DB Stream ID (DBSID):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core
15:8	00h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
7:0	00h RW	<b>DB Target (DBT):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core

### 18.7.115 Door Bell 20 (DOORBELL20)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 304Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>DB Stream ID (DBSID):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core
15:8	00h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
7:0	00h RW	<b>DB Target (DBT):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core

### 18.7.116 Door Bell 21 (DOORBELL21)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3050h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>DB Stream ID (DBSID):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core
15:8	00h RO	<b>Rsvd1:</b> Reserved. <b>Power Well:</b> Core
7:0	00h RW	<b>DB Target (DBT):</b> Refer to field descriptions for the DOORBELL1 register. <b>Power Well:</b> Core

### 18.7.117 Door Bell 22 (DOORBELL22)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 3054h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

This register is modified and maintained by BIOS

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 8070h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000FCC0h

### 18.7.146 Clear Active IN EP ID Control (HOST\_CLR\_IN\_EP\_VALID\_REG)—Offset 807Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 807Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
HOST_CLR_IN_EP_VALID_REG								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p><b>Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):</b> This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.</p> <p><b>Power Well:</b> Core</p>

### 18.7.147 Clear Poll Mask Control (HOST\_CLR\_PMASK\_REG)—Offset 8080h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 8080h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):</b> A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. A write of 1 to this register will issue a cold reset to USB3 ports.  <b>Power Well:</b> SUS
30	0b RW	<b>RESERVED (RSVD):</b> Reserved.  <b>Power Well:</b> SUS
29	0b RW	<b>Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):</b> This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset.  <b>Power Well:</b> SUS
28	0b RW	<b>Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):</b> This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1.  <b>Power Well:</b> SUS
27	0b RW	<b>Disable PERST# Main RST (DIS_PERST_MRST):</b> There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate.  <b>Power Well:</b> SUS
26	0b RW	<b>Disable PCIe PERST# Host Controller (DIS_PERST_HC):</b> There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1.  <b>Power Well:</b> SUS
25	0b RW	<b>Enable Fast Simulation Reset Mode (EN_FAST_RST):</b> Enable a fast simulation mode for reset function. This is a feature for GLS  <b>Power Well:</b> SUS
24	1b RW	<b>Prevent USB3 Link Down Reset (PREV_U3_LDRST):</b> When set to 1, prevent a reset being generated due to the USB3 port link down condition.  <b>Power Well:</b> SUS
23	0b RW	<b>Ignore Main Power Up Reset (IGN_MPU_RST):</b> When set to 1, ignore the main power up reset for USB3 PIPE PHY reset.  <b>Power Well:</b> SUS

Bit Range	Default & Access	Field Name (ID): Description
22	1b RW	<b>RESERVED (RSVD_1):</b> Reserved.  <b>Power Well:</b> SUS
21	0b RW	<b>Ignore HC Reset USB2 (IGN_HC_RST_U2):</b> When set to '1', ignore HC reset to reset the USB2 Port logic.  <b>Power Well:</b> SUS
20	1b RW	<b>Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):</b> When set to '1', ignore HC reset to the USB PHY power-on reset.  <b>Power Well:</b> SUS
19	1b RW	<b>Enable PCIe Link-Down Reset (EN_PLD_RST):</b> Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core.  <b>Power Well:</b> SUS
18	1b RW	<b>Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):</b> When set to '1', enable EEPROM reload on every main power-up.  <b>Power Well:</b> SUS
17	1b RW	<b>Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):</b> When set to '1', ignore HC reset to the PCIe PHY PIPE reset.  <b>Power Well:</b> SUS
16	1b RW	<b>Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):</b> When set to '1', ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset.  <b>Power Well:</b> SUS
15	1b RW	<b>Ignore Warm Reset USB PHY Power (IGN_WR_UPP):</b> When set to '1', ignore warm reset the USB PHY power on reset.  <b>Power Well:</b> SUS
14	1b RW	<b>Allow Core PCIe Link Down Reset (ALL_CPLD_RST):</b> When set to '1', allow PCIe link down to cause a reset to the rest of the core.  <b>Power Well:</b> SUS
13	0b RW	<b>Ignore Hot Reset USB3 (IGN_HR_U3):</b> When set to '1', ignore hot reset to the USB3 port logic.  <b>Power Well:</b> SUS
12	0b RW	<b>Ignore Warm Reset USB3 (IGN_WR_U3):</b> When set to '1', ignore warm reset to the USB3 port logic  <b>Power Well:</b> SUS
11	0b RW	<b>Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):</b> When set to '1', ignore main power up reset to USB3 port logic.  <b>Power Well:</b> SUS
10	0b RW	<b>Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):</b> When set to '1', ignore main power up reset to USB2 port logic.  <b>Power Well:</b> SUS

Bit Range	Default & Access	Field Name (ID): Description
9	0b RW	<b>Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):</b> When set to '1', ignore main power up reset to PCIe core.  <b>Power Well:</b> SUS
8	0b RW	<b>Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):</b> When set to '1', ignore main power up reset to PCIe PHY.  <b>Power Well:</b> SUS
7	1b RW	<b>Ignore HC Reset USB PHY (IGN_HC_RST_UP):</b> When set to '1', ignore HC reset to the USB PHY.  <b>Power Well:</b> SUS
6	1b RW	<b>Ignore Warm Reset USB PHY (IGN_WRST_UP):</b> When set to '1', ignore warm reset to the USB PHY.  <b>Power Well:</b> SUS
5	1b RW	<b>Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):</b> Enables the HC reset or per port reset isolation function.  <b>Power Well:</b> Core
4	1b RW	<b>Allow Power Off Power Domain Reset (ALL_PO_PDRST):</b> When set to '1', allow main power off condition to trigger a main power domain reset.  <b>Power Well:</b> SUS
3	0b RW	<b>Ignore Wait For PERST# During Power Shut Down (IGN_PERST_PSD):</b> When set to '1', ignore waiting for PERST# deassertion during main power shut down.  <b>Power Well:</b> SUS
2	0b RW	<b>Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):</b> If this bit is set and a fundamental reset is asserted during AUX power up, then PERST# shall be ignored and a timeout will be allowed to deassert fundamental reset instead.  <b>Power Well:</b> SUS
1:0	0h RW	<b>Trigger Fundamental Reset (TRIG_FRST):</b> Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset  <b>Power Well:</b> SUS

### 18.7.151 Super Speed Bandwidth Overload (HOST\_BW\_OV\_SS\_REG)—Offset 80C4h

Bit Range	Default & Access	Field Name (ID): Description
24	1b RW	<p><b>Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):</b> This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCIe core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register.</p> <ul style="list-style-type: none"> <li>1 = enables this feature</li> <li>0 = disables this feature.</li> </ul> <p><b>Power Well:</b> SUS</p>
23	0b RW	<p><b>DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):</b></p> <ul style="list-style-type: none"> <li>1 = do not assert PLC for disconnection</li> <li>0 = assert PLC for disconnection</li> </ul> <p><b>Power Well:</b> SUS</p>
22	0b RW	<p><b>TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:</b> This bit enables a feature in PCIe core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error.</p> <ul style="list-style-type: none"> <li>1 = treat Logic IDLE as TS2 received when in some PCIe LTSSM state.</li> <li>0 = disable this feature.</li> </ul> <p><b>Power Well:</b> SUS</p>
21	1b RW	<p><b>Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):</b> We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter.</p> <ul style="list-style-type: none"> <li>1 = disables p2 overwrite due to the D3HOT where PCIe core enters the L1.</li> <li>0 = enables P2 overwrite even if we are in D3Hot.</li> </ul> <p><b>Power Well:</b> SUS</p>

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RO	<b>Reserved (RSVD):</b> Reserved.
19	0b RW	<b>USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):</b> When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition. <b>Power Well:</b> SUS
18	0b RW	<b>USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):</b> When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition. <b>Power Well:</b> SUS
17	0b RW	<b>USB2 link partition clock gating enable (PARUSB2_CLK_GEN):</b> When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition. <b>Power Well:</b> SUS
16	0b RW	<b>USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):</b> When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition. <b>Power Well:</b> SUS
15	0b RO	<b>Reserved1 (RSVD1):</b> Reserved
14	0b RW	<b>USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):</b> When set, allows the aux_clk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it, irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. <b>Power Well:</b> SUS

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW	<p><b>Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):</b> This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated.</p> <ul style="list-style-type: none"> <li>0x0 = 100ms</li> <li>0x1 = 12ms</li> <li>Others = Reserved</li> </ul> <p>Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.</p> <p><b>Power Well:</b> SUS</p>
11:8	4h RW	<p><b>U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):</b> Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well.</p> <ul style="list-style-type: none"> <li>0x0 = 1us</li> <li>0x1 = 128us</li> <li>0x2 = 256us</li> <li>0x3 = 512us</li> <li>0x4 = 640us</li> <li>0x5 = 768us</li> <li>0x6 = 896us</li> <li>0x7 = 1024us</li> <li>Others = Reserved</li> </ul> <p>Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2.</p> <p><b>Power Well:</b> SUS</p>
7	0h RW	<p><b>Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):</b> This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.</p> <p><b>Power Well:</b> SUS</p>
6	0b RW	<p><b>USB2 port clock throttle enable (USB2_PC_TE):</b> When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.</p> <p><b>Power Well:</b> SUS</p>
5	0b RW	<p><b>XHCI Engine Aux clock gating enable (XHCI_AC_GE):</b> When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.</p> <p><b>Power Well:</b> SUS</p>
4	0b RW	<p><b>XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):</b> When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.</p> <p><b>Power Well:</b> SUS</p>
3	0b RW	<p><b>USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):</b> When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.</p> <p><b>Power Well:</b> SUS</p>

### 18.7.190 Debug Capability ID Register (DCID)—Offset 8480h

The Debug Capability *ID Register* links the USB Debug Capability into the xHCI list of Extended Capabilities and defines its basic capabilities. This register is modified and maintained by BIOS.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 8480h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0005000Ah

Bit Range	Default & Access	Field Name (ID): Description
31:21	000h RO	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
20:16	05h RW	<b>Debug Capability Event Ring Segment Table Max (DCERSTM):</b> Valid values are 0-15. This field determines the maximum value supported by the Debug Capability Event Ring Segment Table Base Size registers (see xHCI USB specification), where: The maximum number of Event Ring Segment Table entries = 2^(DCERSTM Max) e.g. if DCERSTM Max = 7, then the <i>Debug Capability Event Ring Segment Table(s)</i> supports up to 128 entries, 15 then 32K entries, etc. Note: This register is sticky. <b>Power Well:</b> Core
15:8	00h RW	<b>Next Capability Pointer (NCP):</b> This field indicates the location of the next capability with respect to the effective address of this capability. Refer to the xHCI USB specification for more information on this field. Note: This register is sticky. <b>Power Well:</b> Core
7:0	0Ah RW	<b>Capability ID (CID):</b> Refer to the xHCI USB specification for descriptions of the capabilities listed below. Note: This register is sticky. <ul style="list-style-type: none"> <li>0 = Reserved</li> <li>1 = USB Legacy Support</li> <li>2 = Supported Protocol</li> <li>3 = Extended Power Management</li> <li>4 = I/O Virtualization</li> <li>5 = Message Interrupt</li> <li>6 = Local Memory</li> <li>7-9 = Reserved</li> </ul> <b>Power Well:</b> Core

### 18.7.191 Debug Capability Doorbell Register (DCDB)—Offset 8484h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 8484h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	00h RW	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
15:8	00h RW	<b>Doorbell Target (DBTGT):</b> This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. <ul style="list-style-type: none"> <li>0 = Data EP 1 OUT Enqueue Pointer Update</li> <li>1 = Data EP 1 IN Enqueue Pointer Update</li> <li>2:255 = Reserved</li> </ul> This field returns '0' when read and the value should be treated as undefined by software. <b>Power Well:</b> Core
7:0	00h RW	<b>Reserved (RSVD_1):</b> Reserved. <b>Power Well:</b> Core

### 18.7.192 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8488h

The Debug Capability *Event Ring Segment Table Size Register* defines the number of segments supported by the Debug Capability Event Ring Segment Table.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 8488h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
15:0	0000h RW	<b>Event Ring Segment Table Size (ERSTS):</b> This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the <i>Debug Capability Event Ring Segment Table Base Address</i> register. The maximum value supported by an xHC implementation for this register is defined by the <i>DCERST Max</i> field in the DCID register. See the xHCI USB specification for more information. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'. <b>Power Well:</b> Core

### 18.7.193 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8490h

The *Debug Capability Event Ring Segment Table Base Address Register* identifies the start address of the Debug Capability Event Ring Segment Table.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**Offset:** [MBAR] + 8490h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:4	00000000 000000h RW	<b>Event Ring Segment Table Base Address Register (ERSTBAR):</b> This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the <i>Debug Capability Enable</i> field in the DCCTRL register to 1.  <b>Power Well:</b> Core
3:0	0h RW	<b>Reserved (RSVD):</b> Reserved.  <b>Power Well:</b> Core

### 18.7.194 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8498h

The *Debug Capability Event Ring Dequeue Pointer Register* is written by software to define the Debug Capability Event Ring Dequeue Pointer location to the xHC. Software updates this pointer when it has finished the evaluation of an Event(s) on the Debug Capability Event Ring.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**Offset:** [MBAR] + 8498h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:4	00000000 000000h RW	<b>Dequeue Pointer (DQP):</b> This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the <i>Debug Capability Enable</i> field in the DCCTRL register to '1'.  <b>Power Well:</b> Core
3	0b RW	<b>Reserved (RSVD):</b> Reserved.  <b>Power Well:</b> Core
2:0	0h RW	<b>Dequeue ERST Segment Index (DESI):</b> This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.  <b>Power Well:</b> Core

### 18.7.195 Debug Capability Control Register (DCCTRL)—Offset 84A0h

The *Debug Capability Control Register* is used to manage the Debug Capability.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 84A0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DCE	DADDR				DMBS	RSVD				DRC	HIT	HOT	LSE	DCR																	

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Debug Capability Enable (DCE):</b> Setting this bit to a 1 enables xHCI USB Debug Capability operation. This bit is a 0 if the USB Debug Capability is disabled. Clearing this bit releases the Root Hub port assigned to the Debug Capability, and terminates any Debug Capability Transfer or Event Ring activity.  <b>Power Well:</b> Core
30:24	00h RO	<b>Device Address (DADDR):</b> This field reports the USB device address assigned to the Debug Device during the enumeration process. This field is valid when the <i>Dc Run</i> bit is 1.  <b>Power Well:</b> Core
23:16	00h RO	<b>Debug Max Burst Size (DMBS):</b> This field identifies the maximum burst size supported by the bulk endpoints of this Dbc implementation. LPT-LP USB Debug Device does not support bursting.  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
15:5	000h RO	<b>Reserved (RSVD):</b> Reserved.  <b>Power Well:</b> Core
4	0b RW/C	<b>DbC Run Change (DRC):</b> This bit shall be set to '1' when DCR bit is cleared to '0', i.e. by any DbC Port State transition that exits the DbC-Configured state. While this bit is 1 the <i>Debug Capability Doorbell Register (DCDB)</i> is disabled. Software shall clear this bit to re-enable the DCDB.  <b>Power Well:</b> Core
3	0b RW/S	<b>Halt IN TR (HIT):</b> While this bit is 1 the Debug Capability shall generate STALL TPs for all OUT DPs received for the IN TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information.  <b>Power Well:</b> Core
2	0b RW/S	<b>Halt OUT TR (HOT):</b> While this bit is 1 the Debug Capability shall generate STALL TPs for all IN TPs received for the OUT TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information.  <b>Power Well:</b> Core
1	0b RW	<b>Link Status Event Enable (LSE):</b> Setting this bit to a 1 enables the Debug Capability to generate Port Status Change Events due to the <i>Port Link Status Change</i> bit transitioning from a 0 to a 1. Refer to the xHCI USB specification for more information.  <b>Power Well:</b> Core
0	0b RO	<b>DbC Run (DCR):</b> When 0, Debug Device is not in the Configured state. When 1, Debug Device is in the Configured state and bulk Data pipe transactions are accepted by Debug Capability and routed to the IN and OUT Transfer Rings. A 0 to 1 transition of the <i>Port Reset (DCPORTSC:PR)</i> bit will clear this bit to 0.  <b>Power Well:</b> Core

### 18.7.196 Debug Capability Status Register (DCST)—Offset 84A4h

The *Debug Capability Status Register* reports capability related status information to software.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 84A4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DPNUM			RSVD				ERNE	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Debug Port Number (DPNUM):</b> This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port. <b>Power Well:</b> Core
23:1	000000h RO	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
0	0b RO	<b>Event Ring Not Empty (ERNE):</b> When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the <i>Debug Capability Event Ring Dequeue Pointer</i> register. <b>Power Well:</b> Core

### 18.7.197 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 84A8h

The fields of the *Debug Capability PORTSC Register* are defined below and provide information about the state of the Root Hub port that is assigned to the Debug Capability. Note that the fields in this register function differently than those in a normal *Port Status and Control Register* (described in section 5.4.8) because the Root Hub port assigned to the Debug Capability is acting as an Upstream Facing Port, not a Downstream Facing Port.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 84A8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

	RSVD		CEC	PLC	PRC	RSVD_1	CSC	RSVD_2	PSPD	RSVD_3	PLS	PR	RSVD_4	PED	CCS

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved (RSVD):</b> Reserved. <b>Power Well:</b> Core
23	0b RW/C	<b>Port Config Error Change (CEC):</b> This flag indicates that the port failed to configure its link partner. <ul style="list-style-type: none"> <li>0 = No change</li> <li>1 = Port Config Error detected</li> </ul> Software shall clear this bit by writing a '1' to it. <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
22	0b RW/C	<p><b>Port Link Status Change (PLC):</b> This flag is set to '1' due to the following PLS transitions:</p> <ul style="list-style-type: none"> <li>• U0 -) U3 = Suspend signaling detected from Debug Host</li> <li>• U3 -) U0 = Resume complete</li> <li>• Polling -) Disabled = Training Error</li> <li>• Ux or Recovery -) Inactive = Error</li> </ul> <p>Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.</p> <p><b>Power Well:</b> Core</p>
21	0b RW/C	<p><b>Port Reset Change (PRC):</b> This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR).</p> <ul style="list-style-type: none"> <li>• '0' = No change</li> <li>• '1' = Reset complete</li> </ul> <p>Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.</p> <p><b>Power Well:</b> Core</p>
20:18	0h RO	<p><b>Reserved (RSVD_1):</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
17	0b RW/C	<p><b>Connect Status Change (CSC):</b> an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.</p> <p><b>Power Well:</b> Core</p>
16:14	0h RO	<p><b>Reserved (RSVD_2):</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
13:10	0h RO	<p><b>Port Speed (PSPD):</b> This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases, this field shall indicate Undefined Speed.</p> <ul style="list-style-type: none"> <li>• 0 Undefined Speed</li> <li>• 1-15 Protocol Speed ID (PSI)</li> </ul> <p>Refer to the xHCI for USB specification for the definition of PSIs. Note: The Debug Capability does not support LS, FS, or HS operation.</p> <p><b>Power Well:</b> Core</p>
9	0b RO	<p><b>Reserved (RSVD_3):</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
8:5	0h RO	<p><b>Port Link State (PLS):</b> This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number ) '0').</p> <ul style="list-style-type: none"> <li>• 0 = Link is in the U0 State</li> <li>• 1 = Link is in the U1 State</li> <li>• 2 = Link is in the U2 State</li> <li>• 3 = Link is in the U3 State (Device Suspended)</li> <li>• 4 = Link is in the Disabled State</li> <li>• 5 = Link is in the RxDetect State</li> <li>• 6 = Link is in the Inactive State</li> <li>• 7 = Link is in the Polling State</li> <li>• 8 = Link is in the Recovery State</li> <li>• 9 = Link is in the Hot Reset State</li> <li>• 15:10 = Reserved</li> </ul> <p>Note: Transitions between different states are not reflected until the transition is complete.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	<p><b>Port Reset (PR):</b></p> <ul style="list-style-type: none"> <li>'1' = Port is in Reset</li> <li>'0' = Port is not in Reset</li> </ul> <p>This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.</p> <p><b>Power Well:</b> Core</p>
3:2	0h RO	<p><b>Reserved (RSVD_4):</b> Reserved.</p> <p><b>Power Well:</b> Core</p>
1	0b RW	<p><b>Port Enabled/Disabled (PED):</b></p> <ul style="list-style-type: none"> <li>'1' = Enabled.</li> <li>'0' = Disabled.</li> </ul> <p>This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software.</p> <ul style="list-style-type: none"> <li>0 = Debug Capability Root Hub port is disabled.</li> <li>1 = Debug Capability Root Hub port is enabled.</li> </ul> <p>When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note: This bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.</p> <p><b>Power Well:</b> Core</p>
0	0b RO	<p><b>Current Connect Status (CCS):</b></p> <ul style="list-style-type: none"> <li>'1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability.</li> <li>'0' = No Debug Host is present.</li> </ul> <p>This value reflects the current state of the port, and may not correspond to the value reported by the <i>Connect Status Change</i> (CSC) field in the <i>Port Status Change Event</i> that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.</p> <p><b>Power Well:</b> Core</p>

## 18.7.198 Debug Capability Context Pointer Register (DCCP)—Offset 84B0h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**Offset:** [MBAR] + 84B0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:4	00000000 000000h RW	<b>Debug Capability Context Pointer Register (DCCPR):</b> This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.  <b>Power Well:</b> Core
3:0	0h RO	<b>Reserved (RSVD):</b> Reserved.  <b>Power Well:</b> Core

### 18.7.199 Debug Capability Device Descriptor Info Register 1 (DCDDI1)— Offset 84B8h

The *Debug Capability Device Descriptor Register 1* identifies the Device Protocol and Vendor ID values that shall be reported by DbC in its Device Descriptor when it is enumerated by a Debug Host. Refer to section 9.6.1, Table 9-8 in the USB3 spec. This register shall be initialized before enabling the DbC (DCE = '1').

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 84B8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description

74-77h	4	"OverCurrent Mapping (OCMAP)—Offset 74h" on page 2371	C0300C03h
7C-7Fh	4	"EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWK)—Offset 7Ch" on page 2371	0000408Ch
F8-FBh	4	"Manufacturer's ID (MANID)—Offset F8h" on page 2374	00000F86h

Bit Range	Default & Access	Field Name (ID): Description
29	0b RWC	<p><b>Received Master-Abort Status (RMA_0):</b> This bit is set when USB2, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.</p> <p><b>Power Well:</b> Core</p>
28	0b RWC	<p><b>Received Target Abort Status (RTA_0):</b> This bit is set when USB2, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.</p> <p><b>Power Well:</b> Core</p>
27	0b RO	<p><b>Signaled Target-Abort Status (STA_0):</b> This bit is used to indicate when the USB2 function responds to a cycle with a target abort. There is no reason for this to happen, so this bit will be hard-wired to '0'. Read-Only</p> <p><b>Power Well:</b> Core</p>
26:25	01b RO	<p><b>DEVSEL# Timing Status (DEVT_0):</b> This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.</p> <p><b>Power Well:</b> Core</p>
24	0b RWC	<p><b>Master Data Parity Error Detected (MDPED_0):</b> This bit is set whenever a data parity error is detected on a USB2 read completion packet on the internal interface to the USB2 host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a '1' to this bit location.</p> <p><b>Power Well:</b> Core</p>
23	1b RO	<p><b>Fast Back-to-Back Capable (FBCAP_0):</b> Reserved as '1'.</p> <p><b>Power Well:</b> Core</p>
22	0b RO	<p><b>User Definable Features (UDF_0):</b> Reserved as '0'</p> <p><b>Power Well:</b> Core</p>
21	0b RO	<p><b>66 Mhz Capable (CLKCAP_0):</b> Reserved as '0'</p> <p><b>Power Well:</b> Core</p>
20	1b RO	<p><b>Capabilities List (CAPLIST_0):</b> Hardwired to '1' indicating that offset 34h contains a valid capabilities pointer.</p> <p><b>Power Well:</b> Core</p>
19	0b RO	<p><b>Interrupt Status (INTRSTS_0):</b> This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.</p> <p><b>Power Well:</b> Core</p>
18:11	00000000b RO	<p><b>Reserved (RSVD):</b> Reserved.</p>

Bit Range	Default & Access	Field Name (ID): Description
10	0b RW	<p><b>Interrupt Disable (INTRDIS_0):</b> When cleared to '0', the function is capable of generating interrupts. When '1', the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. This bit defaults to '0'. This bit is added as part of the PCI 2.3 Specification.</p> <p><b>Power Well:</b> Core</p>
9	0b RO	<p><b>Fast Back to Back Enable (FBE_0):</b> Reserved as '0'.</p> <p><b>Power Well:</b> Core</p>
8	0b RW	<p><b>SERR# Enable (SERREN_0):</b> on a memory read completion (if SERR on Aborts Enable is also set) Detection of an address or command parity error and the Parity Error Response bit is set Detection of a data parity error (when the data is going to the EHC) and the Parity Error Response bit is set</p> <p><b>Power Well:</b> Core</p>
7	0b RO	<p><b>Wait Cycle Control (WCC_0):</b> Reserved as '0'.</p> <p><b>Power Well:</b> Core</p>
6	0b RW	<p><b>Parity Error Response (PER_0):</b> When set to 1, the USB2 Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the EHCI specification. If it detects bad parity on the address or command phases when this bit is set to 1, the host controller does not take the cycle, halts the host controller (if currently not halted) and sets the host system error bit in the USBSTS register. Note that this applies to both requests and completions from the system interface. See section 9.19.2.4 for information regarding parity errors detected by the Prefetch DMA Engine. This bit must be set in order for the parity errors to generate SERR#.</p> <p><b>Power Well:</b> Core</p>
5	0b RO	<p><b>VGA Palette Snoop (VGAPS_0):</b> Reserved as '0'</p> <p><b>Power Well:</b> Core</p>
4	0b RO	<p><b>Postable Memory Write Enable (PMWE_0):</b> Reserved as '0'</p> <p><b>Power Well:</b> Core</p>
3	0b RO	<p><b>Special Cycle Enable (SCE_0):</b> Reserved as '0'</p> <p><b>Power Well:</b> Core</p>
2	0b RW	<p><b>Bus Master Enable (BME_0):</b> When set, bus mastering from EHCI is allowed, and will generate memory reads and writes for USB transfers. Notes on the EHC implementation: - Writes to change this bit occur immediately. Specifically, a write followed by a read will return the updated value. - When the BME bit is changed from 1 to 0, the EHC will cease accessing main memory within 2 microframes (250 usec). During this time, any number of reads and/or writes to memory may occur. - Clearing the BME bit shuts down the EHC DMA engines in the same manner that clearing the Run/Stop does. However, the schedule status bits and the HCHalted bit do not change based on the BME value.</p> <p><b>Power Well:</b> Core</p>
1	0b RW	<p><b>Memory Space Enable (MSE_0):</b> This bit controls access to the USB2 Memory Space registers. If this bit is set, accesses to the USB2 registers are enabled. The Base Address register for USB2 should be programmed before this bit is set.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
0	0b RO	<b>I/O Space Enable (IOSE_0):</b> Reserved as '0'.  <b>Power Well:</b> Core

### 18.8.3 Revision ID and Programming Interface and Sub/Base Class Code (RID\_PI\_CC)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 8h

**Default:** 0C032000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	1	1	0	0	0	
0	0	0	0	0	0	1	0	0	
0	0	0	0	0	0	0	0	0	
BCC_0			SCC_0			PI_0		RID_0	

Bit Range	Default & Access	Field Name (ID): Description
31:24	0Ch RO	<b>Base Class Code (BCC_0):</b> A value of 0Ch indicates that this is a Serial Bus controller.  <b>Power Well:</b> Core
23:16	03h RO	<b>Sub Class Code (SCC_0):</b> A value of 03h indicates that this is a Universal Serial Bus Host Controller.  <b>Power Well:</b> Core
15:8	20h RO	<b>Programming Interface (PI_0):</b> A value of 20h indicates that this USB2 Host Controller conforms to the EHCI specification.  <b>Power Well:</b> Core
7:0	00h RO	<b>Revision ID (RID_0):</b> The value reported in this register indicates stepping of the host controller hardware.  <b>Power Well:</b> Core

## 18.8.4 Reserved and Master Latency Timer and Header Type (RSVD\_MLT\_HT)—Offset Ch

Reserved, for padding Master Latency Timer Header Type Reserved

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD				MFB_0	CFG_LYT_0				MLT_0				RSVD																		

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved (RSVD):</b> Reserved.
23	0b RO	<b>Multi Function Bit (MFB_0):</b> When set to 1 this indicates that this is a multifunction device. Default to 0 since EHCI is at function 0, no other function beyond.  <b>Power Well:</b> Core
22:16	0000000b RO	<b>Configuration Layout (CFG_LYT_0):</b> Hardwired to 0 to indicate a standard PCI configuration layout.  <b>Power Well:</b> Core
15:8	00h RO	<b>Master Latency Timer (MLT_0):</b> Because the USB2 controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0  <b>Power Well:</b> Core
7:0	00h RO	<b>Reserved (RSVD):</b> Reserved.

## 18.8.5 Memory Base Address (MBAR)—Offset 10h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
BA_0							RSVD	PFETCH_0	TYPE_0	RTE_0

Bit Range	Default & Access	Field Name (ID): Description
31:10	000000h RW	<p><b>Base Address (BA_0):</b> Bits (31:10) correspond to memory address signals (31:10), respectively. This gives 1 KB of relocatable memory space aligned to 1 KB boundaries.</p> <p><b>Power Well:</b> Core</p>
9:4	000000b RO	<p><b>Reserved (RSVD):</b> Reserved.</p>
3	0b RO	<p><b>Prefetchable (PFETCH_0):</b> Read Only. This bit is hardwired to 0 indicating that this range should not be prefetched.</p> <p><b>Power Well:</b> Core</p>
2:1	00b RO	<p><b>Type (TYPE_0):</b> indicating that this range can be mapped anywhere within 32-bit address space.</p> <p><b>Power Well:</b> Core</p>
0	0b RO	<p><b>Resource Type Indicator (RTE_0):</b> Read Only. This bit is hardwired to 0 indicating that the base address field in this register maps to memory space</p> <p><b>Power Well:</b> Core</p>

## 18.8.6 USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID\_SSID)—Offset 2Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 2Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
USB2SSID_0				USB2SVID_0				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/L	<b>USB2 Subsystem ID (USB2SSID_0):</b> BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Writes should be done as a single 16-bit cycle. Reset: none  <b>Power Well:</b> Core
15:0	0000h RW/L	<b>USB2 Subsystem Vendor ID (USB2SVID_0):</b> This register, in combination with the USB2 Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Reset: none  <b>Power Well:</b> Core

## 18.8.7 Capabilities Pointer and Reserved (CAP\_PTR\_RSVD)—Offset 34h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 34h

**Default:** 00000050h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD							CAP_PTR_0	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	50h RO	<b>Capabilities Pointer (CAP_PTR_0):</b> This register points to the starting offset of the USB2 capabilities ranges.  <b>Power Well:</b> Core

### 18.8.8 Interrupt Line and Interrupt Pin and Reserved (ILINE\_IPIN\_RSVD)—Offset 3Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 3Ch

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD				IPIN_0				ILINE_0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSVD):</b> Reserved.
15:8	00h RO	<b>Interrupt Pin (IPIN_0):</b> Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. NOTE: As a single function device, only INTA# may be used while the other three interrupt lines have no meaning. (refer to PCI 3.0 spec section 2.2.6 Interrupt Pins)  <b>Power Well:</b> Core
7:0	00h RW	<b>Interrupt line (ILINE_0):</b> This data is not used by the SOC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. Reset: core well and D3-to-D0.  <b>Power Well:</b> Core

### 18.8.9 PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM\_CID\_NEXT\_CAP)—Offset 50h

PCI Power Management Capabilities ID Next Item Pointer #1 Power Management Capabilities

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 50h

**Default:** C9C35801h

31	28	24	20	16	12	8	4	0
1	1	0	0	1	0	0	1	1
1	1	0	0	0	0	1	1	0
1	0	0	1	1	1	0	0	0
0	0	1	1	0	0	0	0	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1

Bit Range	Default & Access	Field Name (ID): Description
31:27	11001b RO	<b>Reserved (RSVD):</b> Reserved.
26	0b RO	<b>D2_Support (D2SUP_0):</b> The D2 state is not supported. Reset: core well, but not D3-to-D0. <b>Power Well:</b> Core
25	0b RO	<b>D1_Support (D1SUP_0):</b> The D1 state is not supported. Reset: core well, but not D3-to-D0. <b>Power Well:</b> Core
24:22	111b RW/L	<b>Aux_Current (AUXCUR_0):</b> The USB2 SIP EHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. <b>Power Well:</b> Core
21	0b RO	<b>DSI (DSI_0):</b> The Intel EHC reports 0, indicating that no device-specific initialization is required. Reset: core well, but not D3-to-D0. <b>Power Well:</b> Core
20	0b RO	<b>Reserved (RSVD):</b> Reserved.
19	0b RO	<b>PME Clock (PMECLK_0):</b> The Intel EHC reports 0, indicating that no PCI clock is required to generate PME#. Reset: core well, but not D3-to-D0. <b>Power Well:</b> Core
18:16	011b RW/L	<b>Version (VERS_0):</b> Version: The Intel EHC reports 011, indicating that it complies with Revision 1.21 of the PCI Power Management Specification. Note: As contingency plan, the bit can be reverted by BIOS to 010b to support PCI PM Revision 1.1, by manipulating the offset80h Access Control register's WRT_RDONLY bit. <b>Power Well:</b> Core
15:8	58h RW/L	<b>Next Item Pointer #1 (PM_NEXT_0):</b> This register defaults to 58h, which indicates that the next capability registers begin at configuration offset 58h. This register is writable when the WRT_RDONLY bit is set. This allows BIOS to effectively hide the Debug Port capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of 58h implies Debug Port and FLR capabilities visible 98h implies Debug Port invisible, next capability is FLR 00h implies that both Debug port and FLR capability are hidden Note that this value is never expected to be programmed. Reset: core well, but not D3-to-D0 <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RO	<b>PCI Power Management Capability ID (PM_CID_0):</b> A value of 01h indicates that this is a PCI Power Management capabilities field.  <b>Power Well:</b> Core

## 18.8.10 Power Management Control/Status (PM\_CS)—Offset 54h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 54h

**Default:** 00000008h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
		RSVD			PMESTS_0	DTScI_0	DTSel_0	PMEEN_0
							RSVD	NO_SOFT_RESET
								RSVD
								PWRST_0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSVD):</b> Reserved.
15	0b RWC	<b>PME_Status (PMESTS_0):</b> This bit is set when the EHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.  <b>Power Well:</b> Resume
14:13	00b RO	<b>Data_Scale (DTScI_0):</b> because it does not support the associated Data register.  <b>Power Well:</b> Resume
12:9	0h RO	<b>Data_Select (DTSel_0):</b> because it does not support the associated Data register.  <b>Power Well:</b> Resume
8	0b RW	<b>PME_En (PMEEN_0):</b> A '1' enables the EHC to generate an internal PME signal when PME_Status is '1'. This bit must be explicitly cleared by the operating system each time it is initially loaded.  <b>Power Well:</b> Resume
7:4	0000b RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	1b RO	<b>No Soft Reset (NO_SOFT_RESET):</b> A '0' indicates device does perform an internal reset upon D3hot to D0 transition via software control of the PowerState bits. Configuration Context is lost. Full re-initialization sequence is needed to return the device to D0 Initialized.(Default to '1') Note: As contingency plan, the bit can be reverted by BIOS to 0, by manipulating the offset80h Access Control register's WRT_RDONLY bit.  <b>Power Well:</b> Resume
2	0b RO	<b>Reserved (RSVD):</b> Reserved.
1:0	00b RW	<b>PowerState (PWRST_0):</b> This 2-bit field is used both to determine the current power state of EHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3hot state, the accesses to the EHC memory range must not be accepted; but the configuration space must still be accessible. When not in the D0 state, the generation of the interrupt output is blocked. Specifically, the PIRQ[H] is not asserted when not in the D0 state. When software changes this value from the D3hot state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.  <b>Power Well:</b> Resume

### 18.8.11 Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP\_CID\_NEXT\_BASE)—Offset 58h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 58h

**Default:** 20A0980Ah

31	28	24	20	16	12	8	4	0

## 18.8.16 Intel-Specific USB2 SMI (ISU2SMI)—Offset 70h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 70h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
SMIonPO1_0				SMIonPMCSR_0	SMIonAsync_0	SMIonPeriodic_0	SMIonCF_0	SMIonHCHalted_0
				SMIonHCRst_0	SMIonPOEn_0			SMIonPMSCREn_0
							SMIonAsyncEn_0	SMIonPeriodicEn_0
							SMIonCFEn_0	SMIonHCHaltedEn_0
							SMIonHCRstEn_0	

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RWC	<b>SMI on PortOwner (SMIonPO1_0):</b> Bits 29:22 correspond to the Port Owner bits for ports 1 (22) through 8 (29). These bits are set to '1' whenever the associated Port Owner bits transition from 0-)1 or 1-)0. Software clears these bits by writing a one. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition  <b>Power Well:</b> Resume
21	0b RWC	<b>SMI on PMCSR (SMIonPMCSR_0):</b> This bit is set to '1' whenever software modifies the Power State bits in the Power Management Control/Status register. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition  <b>Power Well:</b> Resume
20	0b RWC	<b>SMI on Async (SMIonAsync_0):</b> This bit is set to '1' whenever the Async Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition  <b>Power Well:</b> Resume
19	0b RWC	<b>SMI on Periodic (SMIonPeriodic_0):</b> This bit is set to '1' whenever the Periodic Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition  <b>Power Well:</b> Resume
18	0b RWC	<b>SMI on CF (SMIonCF_0):</b> This bit is set to '1' whenever the Configure Flag transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition  <b>Power Well:</b> Resume
17	0b RWC	<b>SMI on HCHalted (SMIonHCHalted_0):</b> This bit is set to '1' whenever HCHalted transitions to '1' as a result of the Run/Stop bit being cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition  <b>Power Well:</b> Resume

Bit Range	Default & Access	Field Name (ID): Description
16	0b RWC	<p><b>SMI on HCRstet (SMIonHCRst_0):</b> This bit is set to '1' whenever HCRESET transitions to '1'. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
15:6	000h RW	<p><b>SMI on PortOwner Enable (SMIonPOEn_0):</b> When any of these bits are '1' and the corresponding SMI on PortOwner bits are '1', then the host controller will issue an SMI. Unused ports should have their corresponding bits cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
5	0b RW	<p><b>SMI on PMSCR Enable (SMIonPMSCREn_0):</b> When this bit is '1' and SMI on PMSCR is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
4	0b RW	<p><b>SMI on Async Enable (SMIonAsyncEn_0):</b> When this bit is '1' and SMI on Async is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
3	0b RW	<p><b>SMI on Periodic Enable (SMIonPeriodicEn_0):</b> When this bit is '1' and SMI on Periodic is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
2	0b RW	<p><b>SMI on CF Enable (SMIonCFEn_0):</b> When this bit is '1' and SMI on CF is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
1	0b RW	<p><b>SMI on HCHalted Enable (SMIonHCHaltedEn_0):</b> When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>
0	0b RW	<p><b>SMI on HCRstet Enable (SMIonHCRstEn_0):</b> When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p><b>Power Well:</b> Resume</p>

## 18.8.19 Manufacturer's ID (MANID)—Offset F8h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + F8h

**Default:** 00000F86h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	0	0	0	1	1	0
RSVD				DPID_0				MSID_0				MAN_0				PPID_0							

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved (RSVD):</b> Reserved.
27:24	0h RO	<b>Dot portion of Process ID (DPID_0):</b> Dot portion of Process ID: Indicates the dot Note: Process is reflected in bits [7:0] This is SIP customer implementation specific and SIP customer need to tie off the field accordingly.  <b>Power Well:</b> Core
23:16	00h RO	<b>Manufacturing Stepping Identifier (MSID_0):</b> Stepping ID: This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Implementation Note: A single Stepping ID can be implemented that is readable from all functions in the chip because all of them are incremented in lock-step.  <b>Power Well:</b> Core
15:8	0Fh RO	<b>Manufacturer (MAN_0):</b> 0Fh = Intel  <b>Power Well:</b> Core
7:0	86h RO	<b>Process portion of process ID (PPID_0):</b> Process portion of process ID: Indicates the process. Note: Dot is reflected in bits [27:24] This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Implementation Note: It is recommended that the Manufacturing ID is implemented in one place and readable from all functions. This minimizes the changes required for a process shrink.  <b>Power Well:</b> Core

## 18.9 USB EHCI Memory Mapped IO Registers

**Table 215. Summary of USB EHCI Memory Mapped I/O Registers—MBAR**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–0h	1	"Capability Registers Length and HC Interface Version Number (CAP_HCIV)—Offset 0h" on page 2376	01000020h
4–4h	1	"Host Controller Structural Parameters (HCSPARAMS)—Offset 4h" on page 2377	00200008h

### 18.9.1 Capability Registers Length and HC Interface Version Number (CAP\_HCIV)—Offset 0h

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 0h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 01000020h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0100h RO	<b>Host Controller Interface Version Number (HCIVERSION_B0_0):</b> This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms.  <b>Power Well:</b> Core
15:8	00h RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	<p><b>Number of Companion Controllers (N_CC_0):</b> This field indicates the number of companion controllers associated with this USB 2.0 host controller. A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports. A value larger than one in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports. There are no companion controllers. This field is set to '0' as Read-Only bit.</p> <p><b>Power Well:</b> Core</p>
11:8	0h RO	<p><b>Number of Ports per Companion Controller (N_PCC_0):</b> This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. Read-Only. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset)</p> <p><b>Power Well:</b> Core</p>
7	0b RO	<p><b>Port Routing Rules (PRR_0):</b> This field indicates the method used by this implementation for how all ports are mapped to companion controllers. This is hardwired to 0, indicating that the first N_PCC (=2) ports are routed to the lowest numbered function companion host controller, the next N_PCC ports are routed to the next lowest function companion controller, and so on</p> <p><b>Power Well:</b> Resume</p>
6:5	00b RO	<p><b>Reserved (RSVD):</b> Reserved.</p>
4	0b RO	<p><b>Reserved (RSVD):</b> Reserved.</p>
3:0	8h RW	<p><b>N_PORTS (NPORTS_0):</b> This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1H to FH. The default value for the EHCI controller indicates 8 ports. BIOS may overwrite the default value to properly describe the board or chip SKU . (please refer to RMH Configuration Details in section 1.23.2). A zero in this field is undefined. Integrated RMH - If USB-R is disabled, this should be updated by BIOS to 2 such that the EHC reports 2ports to be default, port 0 assigned to the RMH and port 1 assigned to the debug device. If USB-R is enabled, the number reported should be updated to 3 by BIOS (port 2 will be assigned to USB-R in this case) Legacy Mode - The default value for the EHCI controller indicates 8 ports. If USB-R support is enabled, BIOS should account for the additional ports in calculating the value to write to this field.</p> <p><b>Power Well:</b> Resume</p>

### 18.9.3 Host Controller Capability Parameters (HCCPARAMS)— Offset 8h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 8h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00036881h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	1	1	0	1
0	0	0	0	0	1	0	0	0
1	0	0	0	1	0	0	0	1
RSVD				ASPFC_0	PSPFC_0	EECP_0	IST_0	RSVD
								ASPC_0
								PFLF_0
								AC64_0

Bit Range	Default & Access	Field Name (ID): Description
31:18	00000000 00000b RO	<b>Reserved (RSVD):</b> Reserved.
17	1b RW	<b>Asynchronous Schedule Prefetch Capability (ASPFC_0):</b> This bit indicates that the hardware support the Asynch schedule prefetch enable bit in the USB command register.  <b>Power Well:</b> Resume
16	1b RW	<b>Periodic Schedule Prefetch Capability (PSPFC_0):</b> This bit indicates that the EHC hardware supports the Periodic Schedule prefetch bit in the USB2 Command Register.  <b>Power Well:</b> Core
15:8	68h RO	<b>EHCI Extended Capabilities Pointer (EECP_0):</b> This field is hardwired to 68h, indicating that the EHCI capabilities list exists and begins at offset 68h in the PCI configuration space.  <b>Power Well:</b> Resume
7:4	8h RO	<b>Isochronous Scheduling Threshold (IST_0):</b> This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. Refer to the EHCI specification for details on how software uses this information for scheduling isochronous transfers. The Intel USB2 hardwires this field to 8h.  <b>Power Well:</b> Resume

Bit Range	Default & Access	Field Name (ID): Description
3	0b RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RO	<b>Asynchronous Schedule Park Capability (ASPC_0):</b> This bit is hardwired to 0 indicating that the Host Controller does not support this optional feature.  <b>Power Well:</b> Resume
1	0b RO	<b>Programmable Frame List Flag (PFLF_0):</b> If this bit is set to a zero, then system software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. If set to a one, then system software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K page boundary. This requirement ensures that the frame list is always physically contiguous. The Intel EHC does not support different frame list lengths. This bit is read-only '0'.  <b>Power Well:</b> Core
0	1b RO	<b>64-bit Addressing Capability (AC64_0):</b> This field documents the addressing range capability of this implementation. The value of this field determines whether software should use the 32-bit or 64-bit data structures. Values for this field have the following interpretation: 0b data structures using 32-bit address memory pointers; 1b data structures using 64-bit address memory pointers The USB2 SIP supports 64-bit addressing only. This bit is read-only '1'.  <b>Power Well:</b> Resume

## 18.9.4 USB2 Command Register (USB2CMD)—Offset 20h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 20h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00080000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
	RSVD		ITC_0		RSVD	UAPMB_0	LHCR_0	IAAD_0
					RSVD		ASE_0	PSE_0
							FLS_0	HCRESET_0
								RS_0

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved (RSVD):</b> Reserved.
23:16	08h RW	<b>Interrupt Threshold Control (ITC_0):</b> This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined. Value Maximum Interrupt Interval 00h Reserved 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames (default, equates to 1 ms) 10h 16 micro-frames (2 ms) 20h 32 micro-frames (4 ms) 40h 64 micro-frames (8 ms) Refer to Section 4 in the EHCI specification for interrupts affected by this field.  <b>Power Well:</b> Core
15:14	00b RO	<b>Reserved (RSVD):</b> Reserved.
13	0b RO	<b>Reserved (RSVD):</b> Reserved.
12	0h RO	<b>Reserved (RSVD):</b> Reserved.
11:8	0h RO	<b>Unimplemented Asynchronous Park Mode Bits (UAPMB_0):</b> This field is hardwired to 000b because the host controller does not support this optional feature.  <b>Power Well:</b> Core
7	0b RO	<b>Light Host Controller Reset (LHCR_0):</b> Read Only 0b. The Intel EHC does not implement this optional reset and hardwires this bit to 0.  <b>Power Well:</b> Core
6	0b RW	<b>Interrupt on Async Advance Doorbell (IAAD_0):</b> This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. See the EHCI specification for operational details. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	<p><b>Asynchronous Schedule Enable (ASE_0):</b> This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0b Do not process the Asynchronous Schedule 1b Use the ASYNCLISTADDR register to access the Asynchronous Schedule.</p> <p><b>Power Well:</b> Core</p>
4	0b RW	<p><b>Periodic Schedule Enable (PSE_0):</b> This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0b Do not process the Periodic Schedule 1b Use the PERIODICLISTBASE register to access the Periodic Schedule.</p> <p><b>Power Well:</b> Core</p>
3:2	00b RO	<p><b>Frame List Size (FLS_0):</b> This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. . This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean: 00b 1024 elements (4096 bytes) Default value; 01b 512 elements (2048 bytes); 10b 256 elements (1024 bytes) - for resource-constrained environments</p> <p><b>Power Well:</b> Core</p>
1	0b RW	<p><b>Host Controller Reset (HRESET_0):</b> This control bit used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Note: PCI Configuration registers and Host Controller Capability Registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Port ownership will be disowned by the host controller(s), with the side effects described in the EHCI spec. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior. This reset must be used to leave EHCI port test modes.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	<p><b>Asynchronous Schedule Status (ASS_0):</b> This bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0).</p> <p><b>Power Well:</b> Core</p>
14	0b RO	<p><b>Periodic Schedule Status (PSS_0):</b> This bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it currently has a request pending, in addition to the regular Periodic DMA engine.</p> <p><b>Power Well:</b> Core</p>
13	0b RO	<p><b>Reclamation (RECL_0):</b> This is a read-only status bit, which is used to detect an empty asynchronous schedule. The operational model and valid transitions for this bit are described in Section 4 of the EHCI Specification.</p> <p><b>Power Well:</b> Core</p>
12	1b RO	<p><b>HCHalted (HCHALT_0):</b> This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it is currently has a request pending, in addition to the regular DMA engines.</p> <p><b>Power Well:</b> Core</p>
11:6	000000b RO	<p><b>Reserved (RSVD):</b> Reserved.</p>
5	0b RWC	<p><b>Interrupt on Async Advance (IAA_0):</b> System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.</p> <p><b>Power Well:</b> Core</p>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RWC	<p><b>Host System Error (HSE_0):</b> The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being set. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs. A hardware interrupt is generated to the system (if enabled in the Interrupt Enable Register).</p> <p><b>Power Well:</b> Core</p>
3	0b RWC	<p><b>Frame List Rollover (FLR_0):</b> The Host Controller sets this bit to a one when the Frame List Index (see Section 9.3.2.4) rolls over from its maximum value to zero. Since the USB2 SIP only supports the 1024-entry Frame List Size, the Frame List Index rolls over every time FRNUM[13] toggles.</p> <p><b>Power Well:</b> Core</p>
2	0b RWC	<p><b>Port Change Detect (PCD_0):</b> The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a zero to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change). Regardless of the implementation, whenever this bit is readable (i.e., in the D0 state), it must provide a valid view of the Port Status registers.</p> <p><b>Power Well:</b> Core</p>
1	0b RWC	<p><b>USB Error Interrupt (USBERRINT_0):</b> The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and Bit 0 are set. See the EHCI specification for a list of the USB errors that will result in this interrupt being asserted.</p> <p><b>Power Well:</b> Core</p>
0	0b RWC	<p><b>USB Interrupt (USBINT_0):</b> The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes).</p> <p><b>Power Well:</b> Core</p>

## 18.9.6 USB2 Interrupt Enable (USB2INTR)—Offset 28h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 28h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
RSVD							IAAE_0	HSEE_0	FLRE_0	PCIE_0	USBIE_0	USBIE_0

Bit Range	Default & Access	Field Name (ID): Description
31:6	0000000h RO	<b>Reserved (RSVD):</b> Reserved.
5	0b RW	<b>Interrupt on Async Advance Enable (IAAE_0):</b> When this bit is a one, and the Interrupt on Async Advance bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit.  <b>Power Well:</b> Core
4	0b RW	<b>Host System Error Enable (HSEE_0):</b> When this bit is a one, and the Host System Error Status bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Host System Error bit.  <b>Power Well:</b> Core
3	0b RW	<b>Frame List Rollover Enable (FLRE_0):</b> When this bit is a one, and the Frame List Rollover bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Frame List Rollover bit.  <b>Power Well:</b> Core
2	0b RW	<b>Port Change Interrupt Enable (PCIE_0):</b> When this bit is a one, and the Port Change Detect bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Port Change Detect bit.  <b>Power Well:</b> Core
1	0b RW	<b>USB Error Interrupt Enable (USBIE_0):</b> When this bit is a one, and the USBERRINT bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software by clearing the USBERRINT bit.  <b>Power Well:</b> Core

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	<p><b>USB Interrupt Enable (USBIE_0):</b> When this bit is a one, and the USBINT bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software by clearing the USBINT bit.</p> <p><b>Power Well:</b> Core</p>

## 18.9.7 Frame Index (FRINDEX)—Offset 2Ch

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 2Ch

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD						FLCIFN_0		

Bit Range	Default & Access	Field Name (ID): Description
31:14	00000000 00000000 b RO	<b>Reserved (RSVD):</b> Reserved.
13:0	00000000 00000b RW	<p><b>Frame List Current Index/Frame Number (FLCIFN_0):</b> The value in this register increments at the end of each time frame (e.g. micro-frame). Bits (12:3) are used for the Frame List current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index</p> <p><b>Power Well:</b> Core</p>

## 18.9.8 Control Data Structure Segment Register (CTRLDSSEGMENT)—Offset 30h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 30h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Upper Address[63 (UPPADDR_0): 32]:</b> This 32-bit field corresponds to address bits 63:32 when forming a control data structure address.  <b>Power Well:</b> Core

### 18.9.9 Periodic Frame List Base Address (PERIODICLISTBASE)—Offset 34h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 34h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	<b>Base Address (BALow_0):</b> These bits correspond to memory address signals (31:12), respectively.  <b>Power Well:</b> Core
11:0	000000000 000b RO	<b>Reserved (RSVD):</b> Reserved.

### 18.9.10 Current Asynchronous List Address (ASYNCLISTADDR)—Offset 38h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 38h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
LPL_0								RSVD			

Bit Range	Default & Access	Field Name (ID): Description
31:5	0000000h RW	<b>Link Pointer Low (LPL_0):</b> These bits correspond to memory address signals (31:5), respectively. This field may only reference a Queue Head (QH).  <b>Power Well:</b> Core
4:0	0000b RO	<b>Reserved (RSVD):</b> Reserved.

### 18.9.11 Configure Flag Register (CONFIGFLAG)—Offset 60h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [MBAR] + 60h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)

**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSVD								CF_0			

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	<p><b>Configure Flag (CF_0):</b> Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below. See section 4 of the EHCI spec for operation details. 0b Port routing control logic default-routes each port to the classic host controllers. 1b Port routing control logic default-routes all ports to this host controller. This register is in the suspend power well. It is only reset by hardware when the suspend power is initially applied or in response to a host controller reset.</p> <p><b>Power Well:</b> Resume</p>

## 18.9.12 Port Status and Control (PORTSC1)—Offset 64h
