8) Short circuit current limit for max. duration of 400 μs , prior to shutdown (see $t_{d(SC)}$ page 4)

9) While demagnetizing load inductance, dissipated energy in PROFET is $E_{AS} = \int V_{ON(CL)} * i_L(t) dt$, approx.

$$E_{AS} = \frac{1}{2} * L * I_L^2 * \left(\frac{V_{ON(CL)}}{V_{ON(CL)} - V_{bb}} \right), \text{ see diagram page 8}$$

10) Reverse load current (through intrinsic drain-source diode) is normally limited by the connected load.
Reverse current I_{GND} of $\approx 0.3\text{ A}$ at $V_{bb} = -32\text{ V}$ through the logic heats up the device. Time allowed under these condition is dependent on the size of the heatsink. Reverse I_{GND} can be reduced by an additional external GND-resistor ($150\text{ }\Omega$). Input and Status currents have to be limited (see max. ratings page 2 and circuit page 7).
