- Wide operating temperature range: $T_a=-40\sim +85^\circ\text{C}$

APPLICATION

General purpose, for use in industrial and consumer digital equipment.

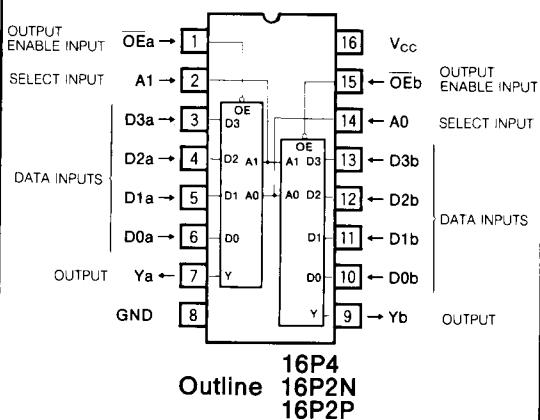

FUNCTIONAL DESCRIPTION

Use of silicon gate technology allows the M74HC153 to maintain the low power dissipation and high noise margin characteristics of the standard CMOS logic 4000B series while giving high-speed performance equivalent to the 74LS153.

The M74HC153 consists of data selector functions for selecting one of four input line signals and multiplex functions for converting 4-bit parallel data into serial data using time-division.

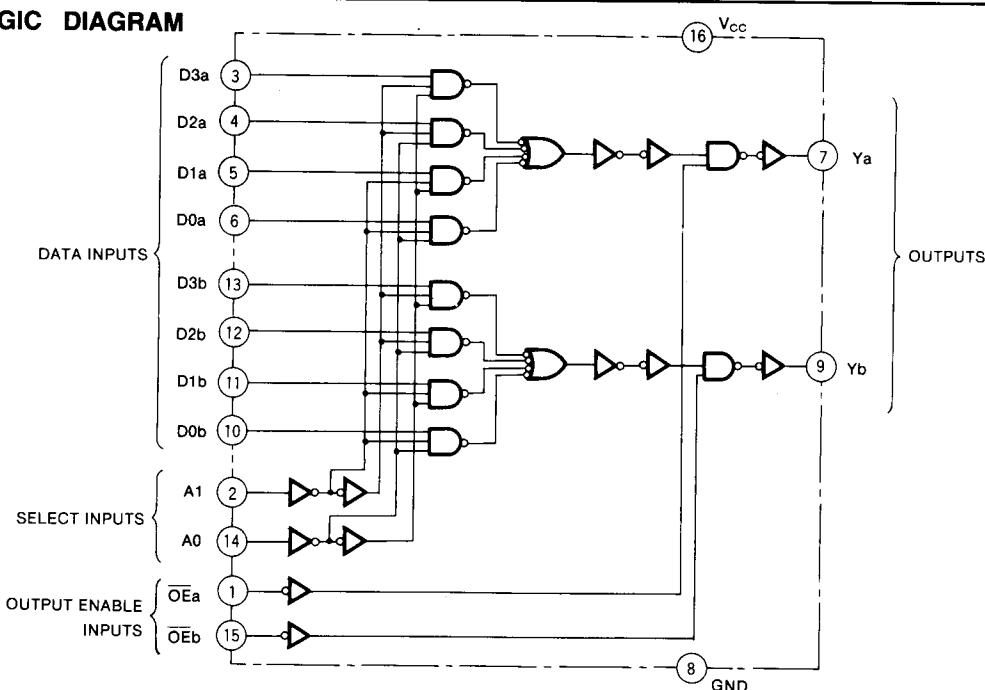

The 4-line signal is applied to data inputs D0 through D7, and after one of the data inputs has been selected by select inputs A0 and A1, that input signal will be output at

PIN CONFIGURATION (TOP VIEW)

Y. By applying 4-bit parallel data to D0 through D3 and connecting the output of a synchronous quadruple counter to A0 and A1, D0 through D3 data will be output at Y synchronous with the clock pulse in the order of D0-D3. Select inputs A are common to the two circuits while the output-enable inputs \overline{OE} are independent. When \overline{OE} is high, Y will become low irrespective of other inputs.
